CODEN: SWRABW

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

LIBRARY U. OF I. URBANA-CHAMPAIGN

VOLUME 9, NUMBER 21
NOVEMBER 1, 1976

W76-11101 -- W76-11625

Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

Doc.
I 1.94/2:
9/21-24

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed [illegible]tection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

THE VOLUMETRIC PROPERTIES OF H20--A GRAPHICAL PORTRAYAL,
Geological Survey, Reston, Va.
J. R. Fisher.
Journal of Research of the U S Geological Survey, Vol 4, No 2, p 189-193, March-April 1976. 4 fig, 3 ref.

Descriptors: *Water properties, *Volumetric analysis, *Graphical analysis, Contours, Pressure, Density, Temperature.

A graphical display of the volumetric properties of water is presented as density (0.01 to 1.0 g/cm to the minus 3) contoured on pressure-temperature coordinates and pressure (1-10,000 bars) contoured on density-temperature coordinates over the temperature range 0-1,000 degrees C. Data were obtained from sources published during 1964-1969; several minor inconsistencies are observed and attributed to inadequacies in the equations of state used to describe experimental data obtained above 1,000 bars. INFLUENCE OF SIMPLIFICATIONS IN WATERSHED GEOMETRY IN SIMULATION OF SURFACE RUNOFF,
Agricultural Research Service, Tucson, Ariz.
L. J. Lane, D. A. Woolhiser, and V. Yevjevich.
Hydrology Papers, Colorado State University, Fort Collins, No. 81, December 1975. 52 p, 47 fig, 11 tab, 54 ref.

Descriptors: *Mathematical models, *Model studies, *Surface runoff, *Watersheds(Basins), Channels, Rainfall-runoff relationships, Overland flow, Hydrograph analysis, Runoff.
Identifiers: *Kinematic cascade model, Kinematic impulse response.

The effects of simplification in formulating mathematical models for analyzing surface runoff are described. The purpose is to develop objective procedures for geometric simplification of complex watersheds modeled as kinematic cascades of planes and channels. A useful conception of a watershed surface is that it consists of the channel network and interchannel areas of overland flow within the watershed perimeter. Basic models are outlined for watershed geometry and rainfall excess-surface runoff; analysis is made of overland flow over uniform and complex slopes, with specific discussion of storage at equilibrium, kinematic impulse response and pulse response. Runoff from complex watersheds is described using goodness-of-fit statistics for simplified geometry, hydrograph fitting and analysis of hydraulic roughness parameters. Kinematic impulse response analysis emphasizes the influence of surface configuration on overland flow. (Jahns-Arizona)

IFYGL WEATHER HIGHLIGHTS,
Atmospheric Environment Service, Toronto (Ontario). Lake and Marine Applications Section.
D. W. Phillips.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 296-320, 1974. 7 fig, 5 tab, 14 ref.

Descriptors: *Weather, *Weather data, *Lake Ontario, *Great Lakes, Climatology, Meteorology, Rainfall, Snowfall, Precipitation(Atmospheric), Networks, Temperature, Flooding, Solar radiation, Winds, Evaporation, Evapotranspiration, Runoff, Hurricanes, Storms, Lakes.
Identifiers: *International Field Year for the Great Lakes, Hurricane Agnes, Weather highlights.

One of the principal goals of International Field Year for the Great Lakes (IFYGL) Project 24 ME, Climatological Studies, is to assist principal investigators by comparing monthly averages of various meteorological variable during the data-gathering period with normals computed from the 1941-1970 period. Before data interpretation and model testing begin or before results are extrapolated elsewhere, conditions under which the scientific data were collected should be known. The weather during the data-gathering period of IFYGL could be described as cold, stormy, and dull. The mean annual temperature was within one degree of normal; however, five months had temperatures between one and three standard deviations. The period was also one of almost continuous, heavy precipitation and frequent flooding. Total precipitation from April 1972 to March 1973 varied from 800 mm north north of Toronto to 1600 mm in the Adirondacks, averaging about 175 mm greater than normal. Every month had an above normal number of days with precipitation, for an annual total of 45 rain days more than usual. The number of hours of sunshine was almost 200 hours fewer than normal (90%). The outstanding weather event of the field year was the torrential rain and widespread flooding caused by Hurricane Agnes. Rains totalling more than a foot fell in parts of the basin from the evening of the 20th of June until the morning of the 25th. For most of the Ontario side five day totals ranged from two to three inches. (See also W76-11275) (Sims - ISWS)

In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 334-347, 1974. 11 fig, 1 tab, 5 ref.

Descriptors: *Remote sensing, *Snow cover, *Ice cover, *Great Lakes, Satellite(Artificial), Snow, Ice, Mapping, Watersheds(Basins), Instrumentation, Infrared radiation, Lake ice, Temperature, Water temperature, Cloud cover, Water resources, Surveys.
Identifiers: *International Field Year for the Great Lakes, ERTS-1, NOAA-2.

Three snow-extent maps of the Lake Ontario drainage basin were prepared from NOAA-2 satellite visible band images during the IFYGL (1972-1973). These maps were discussed and the satellite data were evaluated for snow-extent mapping. The value of ERTS-1 imagery and digital data was also discussed in relation to the Lake Ontario basin studies. ERTS-1 MSS data are excellent for ice identification and analysis but are not useful for forecasting where timely receipt of data is imperative. NOAA-2 VHRR data are timely but the lower resolution of the VHRR makes identification of certain ice features difficult. NOAA-2 VHRR is well suited for snow-extent maps and thermal maps of large areas such as the 19,000 sq km Lake Ontario basin. (See also W76-11275) (Sims - ISWS)

THE TILTED FOREST: GLACIOLOGICAL-GEOLOGIC IMPLICATIONS OF VEGETATED NEOGLACIAL ICE AT LITUYA BAY, ALASKA,
Geological Survey, Tacoma, Wash.
A. Post, and G. Streveler.
Reprint from Quaternary Research, Vol 6, No 1, p 111-117, March 1976. 4 fig, 6 ref.

Descriptors: *Glaciers, *Alaska, *Vegetation effects, *Coniferous forests, *Glaciology, Time, Age, Dating, Time lag, Bays.
Identifiers: Lituya Bay(Ala).

Porter and Carson postulated that stagnant, forest-covered ice persisted as long as 2,000 years after the retreat of late Pleistocene glaciers in Puget Sound, Alaska, and cite as present examples several large, still active Alaskan glaciers which have forested margins. A better example was found in Lituya Bay, which was occupied by glacier ice until about 300-400 years ago. On the forested western side of the bay, tilted trees suggested buried ice; after considerable search, an exposure of clean, bubbly glacier ice was found under a mantle of forest duff and debris 1-2 m thick. The calculated melt rate suggests that some of this ice may persist for at least another 300 years. The 600+ years persistence of this stagnant ice supports the hypothesis that much larger forest-mantled deposits lingered as much as 2,000 years following the retreat of late Pleistocene glaciers. (Woodard-USGS)

THE DETERMINATION OF REGIONAL EVAPOTRANSPIRATION BY MEANS OF STANDARD METEOROLOGICAL DATA,
Cornell Univ., Ithaca, N. Y. School of Civil and Environmental Engineering.
W. H. Brutsaert.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-256 213, $4.50 in paper copy, $3.00 in microfiche. Cornell University Water Resources and Marine Sciences Center, Completion Report, August 1976. 47 p, 6 fig., 7 tabs., 27 ref. OWRT B-052-NY(1). 14-34-0001-6101.

Descriptors: *Evapotranspiration, *Boundary layers, *Radiosoundes, *Water vapor, Atmospheric physics, Meteorological data, *Nebraska, Regional analysis, Watershed management.
Identifiers: Atmospheric boundary layers.

A recently proposed procedure to calculate actual regional evapotranspiration, using only regularly recorded upper air meteorological data, based on the parameterization of the turbulent atmospheric boundary layer was further investigated in an attempt to develop guidelines for its application in the solution of hydrological problems. In a first phase a comparison was continued between predicted evapotranspiration and measured watershed evapotranspiration in eastern Nebraska. It was found that contrary to the general assumption, the similarity function for water vapor in the atmospheric boundary layer is different from that for sensible heat. This prompted the second phase of the research which will consist of an exhaustive study of available meteorological data to obtain a more accurate determination of the water vapor and sensible heat transfer coefficients for the boundary layer. Preliminary results confirm the findings of the first phase.
W76-11110

COMPARISON OF METHODS FOR ESTIMATING POTENTIAL EVAPOTRANSPIRATION IN THE NORTH PLATTE BASIN OF WYOMING,
Wyoming Univ., Laramie. Dept. of Agricultural Engineering.
R. W. VanKlaveren, L. O. Pochop, and W. E. Hedstrom.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-256 236 $4.00 in paper copy, $3.00 in microfiche. Wyoming Water Resources Research Institute Laramie, Series No. 59, May 1976. 33 p, 27 fig, 8 ref. OWRT A-014-WYO(2), 14-31-0001-3851, 4051, 5051.

Descriptors: *Evapotranspiration, Model studies, *Wyoming, Evaporation pans, *Methodology, *Estimating.
Identifiers: Jensen-Haise method, Thornthwaite method, Blaney-Criddle method.

Three methods of estimating potential evapotranspiration, the Modified Jensen-Haise, Thornthwaite, and Blaney-Criddle methods, were evaluated and compared to adjusted pan evaporation. Average long-term daily estimates of evapotranspiration using the Modified Jensen-Haise method were generally higher while the values from the Thornthwaite and Blaney-Criddle methods were generally lower than adjusted pan evaporation. Estimates of evapotranspiration for stations where pan data were not available followed the same basic patterns. The Jensen-Haise method always gave the highest estimates and the Thornthwaite the lowest.

MONTHLY EVAPOTRANSPIRATION ESTIMATES FOR THE CANADIAN LAND PORTION OF THE LAKE ONTARIO BASIN DURING THE IFYGL,
Atmospheric Environment Service, Downsview (Ontario). Hydrometeorology and Environmental Impact Research Div.
H. L. Ferguson and W. D. Hogg.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1, McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 269-287, 1974. 6 fig, 12 tab, 18 ref.

Descriptors: *Evapotranspiration, *Model studies, *Canada, *Lake Ontario, Evaporation, Mathematical models, Computer models, Rainfall, Solar radiation, Temperature, Winds, Humidity, Vegetation, Vegetation effects, Crops, Climatology, Meteorology.
Identifiers: *International Field Year for the Great Lakes.

A grid-square technique for calculating monthly evapotranspiration was developed in 1972 and tested in the Okanagan Basin of British Columbia. This method has been adapted to the Canadian land portion of the Lake Ontario Basin. The first step in the analysis is the tabulation of selected cover and physiographic characteristics for 136 grid areas of 400 sq km. Next, regression equations are obtained relating longer-term mean climatological data to cover and physiography. Grid area mean monthly values of precipitation, temperature and 'lake evaporation' (based on Class A pan network data) are then tabulated. Ratios of mean monthly evapotranspiration to mean lake evaporation, for various cover types, are postulated, based on other studies. Grid square values of mean monthly evapotranspiration are obtained. Iteration and optimization techniques can be applied to obtain 'best fit' fields of mean evapotranspiration and precipitation, consistent with mean runoff. Individual months of the International Field Year on the Great Lakes are then analyzed. Grid values of monthly 'deviations from normal' for the water balance variables are generated. The deviation fields are added to the normal fields to obtain monthly grid-area values of the water balance variables. These data can be used to generate monthly maps of 'lake evaporation', actual evapotranspiration, and other variables of interest. Results are compared at selected locations to estimates of evaporation obtained from the Thornthwaite and Penman methods. (See also W76-11275) (Sims - ISWS)

A SIMPLE AND RAPID METHOD OF SOIL WATER DETERMINATION,
Himachal Pradesh Univ., Palampur (India). Coll. of Agriculture.
G. C. Aggarwal, and B. R. Tripathi.
Journal of Soil Science, Vol. 26, No. 4, p 437-439, December 1975. 1 tab, 2 ref.

Descriptors: *Soil water, *Soil texture, *Soil tests, *Moisture content, Soil density, Measurement, Instrumentation, Methodology.
Identifiers: *Pycnometers.

Soil water can be determined rapidly using a wide-mouthed pycnometer weighed after filling with a soil sample and a suitable amount of water. The particle density of the soil and weight of the water-filled pycnometer must be ascertained first; exact water volumes are unnecessary. Equations are provided for calculating the sample's dry weight and water content. This method gave water content values similar to those obtained by oven-drying when tested on seven soils varying in texture from sandy to silt clay loam, with pH from 5.8 to 8.2 and organic carbon from 0.14 to 1.35%. Water contents varied from 2.60 to 21.61 % by the oven-drying method and from 2.49 to 21.42% by the pycnometer method. This technique also takes into account the floating organic particles discarded in other methods, thus making it more suitable even for soils high in organic matter. (Jahns-Arizona)

SIMULATION OF THE WATER BALANCE OF SOIL COLUMNS AND FALLOW SOILS,
National Vegetable Research Station, Wellesbourne (England).
H. R. Rowse.
Journal of Soil Science, Vol. 26, No. 4, p 338-349, December 1975. 7 fig, 22 ref.

Descriptors: *Water balance, *Soil moisture, *Fallowing, *Evaporation, *Soil water movement, Soil dynamics, Soil types, Model studies, Flow, Diffusivity, Impact(Rainfall).

A model is described to predict water evaporation from and distribution in a soil column evaporating into a constant environment. The model is based on a numerical solution of the flow equation and requires only the column's initial water distribution, the equilibrium (air-dry) water content at the soil surface and the relationship between volumetric water content and diffusivity, the latter parameter being most important. Model predictions are in accord with a published analytical solution (Rose, 1968) and with experimental results. Water balance in a fallow field can be predicted with modifications to the model that allow for soil rewetting by rainfall and atmospheric changes above the soil. Since coarse sand had a distinct drying front, the method used to determine diffusivity was the main cause of disparity between the model and experimental results; sandy loam soils did not present this problem Generally good agreement was obtained with the measured distribution of water deficits in the soil profile. (Jahns-Arizona)

Descriptors: *Desalination, *Pacific Ocean, *Advection, Rainfall, Salinity, Surface waters, Tropical regions, Evaporation, Evapotranspiration.
Identifiers: *Polynesia.

In the SW tropical Pacific, desalted water has 2 origins: the W Pacific Ocean and N of Polynesia. The desalted water is usually generated in areas where rainfall is strong, and then carried away by zonal advection; the desalted area N of Polynesia could also be supplied by meridian advection through the equator.--Copyright 1975, Biological Abstracts, Inc.

2E. Streamflow and Runoff

HYDROLOGIC ASPECTS OF FLOOD MANAGEMENT IN THE CHEMUNG RIVER BASIN,
Cornell Univ., Ithaca, N. Y. School of Civil and Environmental Engineering.
W. H. Brutsaert.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-256 211, $4.00 in paper copy, $3.00 in microfiche. Completion Report, Water Resources and Marine Sciences Center, Cornell University, Ithaca, New York, (1976). 32 p, 6 fig, 3 tab, 26 ref. OWRT A-060-NY(1). 14-31-0001-5032, 14-34-0001-6033.

Descriptors: *Flood forecasting, *Flood peak, *Rainfall-runoff relationships, *Unit hydrographs, *Runoff forecasting, Hydrologic systems, Management, River basins, *New York, Runoff, Streams, Watershed management, Model studies.
Identifiers: Chemung River basin(NY).

The process of watershed runoff resulting from extreme and complex flood-producing rainstorms was analyzed by the nonlinear systems approach. As an extension of the classical unit hydrograph method, a watershed system can be modeled in terms of a Volterra integral series. In this research the optimal identification of the first and second order unit response functions was carried out by means of data collected during major historical flood events on several watersheds of the Chemung River Basin. The basins selected were: Tioga River (Tioga, Pa.), Cowanesque River (Lawrenceville, Pa.), Tuscarora Creek (South Addison, N. Y.), Cohocton River (Campbell, N. Y.) and Newton Creek (Elmira, N. Y.). The response functions were determined by a Galerkin-type procedure in terms of an orthogonal expansion by means of Chebyshev polynomials. The resulting formulation was tested with available data from Tropical Storm Agnes of June 1972, which brought about the biggest flood in the history of the Susquehanna Basin. It was found that the nonlinear watershed model yields a better prediction of the hydrograph of an exceptional flood than the classical linear approach. The performance of any model is sensitive to the assumed rainfall loss rates.

Identifiers: *Sutter Basin(Calif).

Three-dimensional plotting provides a means for interpretation and illustration of results and dynamic findings from finite element simulation. However, the computer graphic package as available at various computer centers requires data on a regular grid. It cannot be adopted for isoparametric finite elements since the elements are combinatiors of various shapes and sizes of trapezoids. Computer programs have been developed to interpolate the data from irregular finite element grid such that three-dimensional plottings can be generated to depict results from two or three dimensional finite element solution. The program developed has the option of generation of plots as viewed from various angles, varying number of contours and vertical scale. The capabilities of this program are illustrated by using specific examples of 3-D finite element solution of groundwater flow, Sutter Basin, California. (Snyder - California, Davis)

GROUND-WATER RESOURCES AND WATER USE IN SOUTHERN NAVAJO COUNTY, ARIZONA,
Geological Survey, Tucson, Ariz.
L. J. Mann.
Arizona Water Commission Phoenix, Bulletin 10, May 1976. 106 p, 6 fig, 4 plates, 6 tab, 24 ref, append.

Descriptors: *Groundwater resources, *Water quality, *Aquifer characteristics, *Hydrologic data, Water wells, Water utilization, Water supply, Water yield, Available water, Streamflow, Groundwater recharge, Water analysis, Chemical analysis, *Arizona.
Identifiers: Navajo County(Ariz).

The main source of water in the 3,400-square-mile area of southern Navajo County, Ariz., is the groundwater in storage in the Coconino aquifer, which underlies the entire area. About 76 percent of the water supply is from the Coconino aquifer, about 6 percent is from the Pinetop-Lakeside aquifer and from the alluvium along the large stream channels and flood plains, about 15 percent

LIBRARY U. OF I. URBANA-CHAMPAIGN

is from surface water, and about 3 percent is imported. Most groundwater withdrawn from the Coconino aquifer is for agricultural and industrial uses, and, in general, water levels have declined less than 5 feet. The sedimentary and basaltic rocks of the Pinetop-Lakeside aquifer supply water to the Pinetop-Lakeside recreational area, where the water in some wells has been polluted by sewage effluent. The water in the Pinetop-Lakeside aquifer is hydraulically separated from the water in the underlying sandstone Coconino aquifer. In general the groundwater in the southern part of the area is of good chemical quality; however, the water in the northern part of the area generally contains large concentrations of dissolved solids--mainly sodium, chloride, and bicarbonate. In the northernmost part of the area water in the Coconino aquifer is unsuitable for human or livestock consumption, irrigation, and most industrial uses. (Woodard-USGS)

FEASIBILITY OF MODELLING THE INFLUENCES OF PIT RECHARGE ON GROUND-WATER LEVELS AND QUALITY IN ALLUVIAL BASINS,
Water Resources Research Center, Tucson.
L. G. Wilson, W. O. Rasmussen, and D. F. O'Donnell.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 584, $4.50 in paper copy, $3.00 in microfiche. Completion Report, July 1976. 66 p, 19 fig, 11 tab, 28 ref, append. OWRT A-056-ARIZ(2). 14-31-0001-5003.

Descriptors: Finite element analysis, Water wells, *Artificial recharge, *Pit recharge, Hydraulic models, *Model studies, *Arizona, Water quality, Groundwater movement, Aquifers.
Identifiers: *Tucson basin(Ariz), *Finite difference models.

Specific objectives included (1) examining the effect of pit recharge, using industrial blowdown effluent, on local ground-water levels and quality in the Tucson basin; and (2) evaluaing the applicability of two digital models for modelling the hydraulic response of the aquifer to pumping and recharge. Fourteen pit trials ranging from 1 day to 185 days duration were imlemented during a two year period. The total volume of effluent recharged was 157 ac-ft. Pit recharge on a limited basis did not appear to offset the general decline in local ground-water levels. However, recharge deteriorated the quality of ground water in shallow (150 ft) wells but not in a deeper (300 ft) well. A finite difference (FD) model and a finite element model (FEM) were used to simulate hydraulic conditions in a 2000 ft by 2000 ft aquifer region near the pit. An attempt was made to calibrate the models using water level data from a two-week aquifer test on a shallow well. Results were depicted using a three-dimensional graphics technique (SYMVU). Better results were obtained with the FD model than with the FEM, primarily because a finer mesh was used to discretize the region with the FD model than with the FEM. Results of the FEM were also biased by the rectangular configuration of the aquifer boundary. The finite element model was used to simulate aquifer response during a pit recharge test. Again, results were limited by the injudicious selection of elements and boundary configurations.

PETROGRAPHIC AND GEOHYDROLOGIC MODEL OF AQUIFER LIMESTONES IN FLORIDA,
Florida Univ., Gainesville. Dept. of Geology.
A. F. Randazzo.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-256 761 $4.50 in paper copy, $3.00 in microfiche. Florida Water Resources Research Center, Gainesville, Publication No. 35, 1976. 51 p, 17 fig, 4 tab, 74 ref. OWRT A-025-FLA(3), 14-34-0001-6010.

Descriptors: *Groundwater movements, *Porosity, *Permeability, *Florida, *Model studies, *Petrography, Aquifer characteristics, *Dolomite, Magnesium, Lithologic logs, Diagenesis.

Petrographic analysis of 14 cores penetrating the Inglis and Avon Park Formations (Floridan Aquifer) reveals several distinct lithofacies representing multiple regressive-transgressive cycles, aerial exposure, and diagenesis. Evolution of pore spaces varies with lithofacies and a function of primary deposition and diagenetic history. The general tendency has been toward obliteration of primary voids by compaction and calcite and dolomite infilling, but several zones have experienced dissolution enlargement. There is evidence for penecontemporaneous dolomitization in supratidal environment, as well as post-depositional dolomitization by Mg-rich groundwater flushing. Various dolomite textures can be used to predict the environment of dolomitization. These textures are: (1) replacement dolomitization of the total sediment so that original fabrics are preserved; (2) dolomitization by aggrading neomorphic processes; and (3) replacement dolomitization of fossils and pellets only. The petrographic model presented, provides the framework into which the known geohydrologic and hydrochemical models can be integrated. (Morgan-Florida)

FRAGIPAN STABILITY IN SOIL-PLANT EFFLUENT DISPOSAL SYSTEMS,
Missouri Univ., Columbia. Dept. of Agronomy.
C. R. Edmonds, and R. W. Blanchar.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-256 228, $6.00 in paper copy, $3.00 in microfiche. Missouri Water Resources Research Center, Columbia, Completion Report, July 1, 1976. 133 p, 23 fig, 16 tab, 86 ref, append. OWRT A-087-MO(1), 14-34-0001-6026.

Descriptors: Effluents, *Hydraulic conductivity, *Soil strength, *Missouri, *Waste disposal, *Root development, Soil horizons, Soil profiles, *Acidity, *Bulk density, Lime, Root distribution, Root systems, Soil analysis.
Identifiers: *Fragipan horizon.

A large percentage of Ozark soils in Missouri possess a fragipan horizon. The fragipan restricts water movement and root growth in the profile. This study was conducted to evaluate the effect of changes in acidity and bulk density on the Hobson fragipan with respect to root growth and hydraulic conductivity. Chemical and physical tests associated with basic soil properties were conducted. Ion exchange relationships of six ion pairs, along with ion products of Fe, Al, and Mn hydroxides were examined. Hydraulic conductivity, probe penetration, and root growth experiments were conducted on reformed and natural samples of B2 and fragipan horizons. The rate of probe penetration had no effect on point resistance in reformed cores. Both acidity and high bulk density restrict root growth in the Hobson B2 and fragipan horizons. Data suggest low pH could induce Al toxicity in unlimed samples of both the B2 and fragipan soil. In reformed cores root growth was restricted at strengths between 10 and 20 bars, and greater strengths effectively stopped root growth. Strength of undisturbed B2 and fragipan cores was 20 to 25 bars and greater than 100 bars, respectively, at 0.33 bar moisture tension. No roots penetrated either core. The hydraulic conductivity of reformed cores was only slightly increased due to calcium oxide addition. Indications are the fragipan would remain stable with respect to roots and water movement unless it was physically modified. Profile modification would need to be supplemented with lime to effectively increase root distribution in the Hobson profile.

EFFECT OF DILUTED SEA WATER ON THE BASE STATUS OF AN ACID SOIL,
West Pakistan Agricultural Univ., Lyallpur. Dept. of Soil Sciences.
S. Muhammad.
Pak J Sci Res. 24(1/2), p 77-85, 1972.

Descriptors: *Sea water, *Acidic soils, Adsorption, Loam, Soil chemistry, Sodium, Magnesium, Leaching.

Columns of an acid Lauren loam soil were leached, with diluted sea water to study its effect on the exchangeable base status of the soil. One set of soil columns was leached with 33 acre-inches of SW/10 followed by 39 acre-inches of SW/1000 and the other set was leached with 33 acre-inches of SW/100 followed by 39 acre-inches of SW/1000. There were substantial gains in exchangeable Mg and Na and similar losses in Ca. The gains in H + Al increased with increasing initial base saturation of the soil. No soil column reached equilibrium with the leaching waters as indicated by continued adsorption of Mg by the soil and by differences in SAR (Na adsorption ratio) values of applied waters and ESP (exchangeable Na percentage) of the soil at the end of the experiment.--Copyright 1974, Biological Abstracts, Inc.

SOIL PROPERTIES AS AFFECTED BY TOPOGRAPHY IN DESERT WADIS,
Cairo Univ., Giza (Egypt). Faculty of Science.
K. H. Batanouny.
Acta Bot Acad Sci Hung. 19(1-4), p 13-21, 1973.

Descriptors: *Soil physical properties, Deserts, Africa, Physiography, Plant growth, *Soil depth, *Soil texture.
Identifiers: Topography, *Wadis.

Studies were carried out in one of the wadis of the Egypto-Arabian desert, namely wadi Hof near Helwan. The site studied was a part of the wadi, with numerous terraces and an irregular topography. Changes in the topography lead to the differentiation of a number of microhabitats spaced a few m apart. Each of them had their peculiar environmental conditions and plant cover. The soil properties, espececially texture and depth, played an important role in the plant life of the desert. This was mainly through through their controlling effect on the amount and availability of the water supply. It was shown that the soil properties varied widely in the different microhabitats. Such variation was referred to the topographic irregularities in the wadi. The physiographic features in a desert wadi, through their effect on the soil properties and in turn on the water resources, were the major factors affecting the distribution of the plant communities.--Copyright 1974, Biological Abstracts, Inc.

RATIONALIZATION OF IONIC STRENGTH AND CATION EFFECTS ON PHOSPHATE SORPTION BY SOILS,
Massey Univ., Palmerston North (New Zealand). Dept. of Soil Science.
J. C. Ryden, and J. K. Syers.
Journal of Soil Science, Vol. 26, No. 4, p 395-406, December 1975. 2 tab, 4 fig, 23 ref.

Descriptors: *Phosphates, *Cations, *Cation adsorption, *Ion exchange, *Sorption, Soil chemistry, Soil dynamics, Kinetics, Isotherms, Soil investigations, Equilibrium.

Inorganic phosphate amounts sorbed by four contrasting unfertilized soils over a 40-hour period were influenced by the ionic strength and cation species of the contacting solution (support medium), as indicated by isotherms over the final P concentration range of 0 to 1 and 0 to 10 micro-g P/ml. P sorption was enhanced by increases in ionic strength, especially in support media with increasing Na or Ca concentrations. Sorption is also influenced by pH. Kinetic studies revealed that, within the P addition range used for each soil, equilibrium P concentration was independent of ionic strength and cation species; solution composition thus affected only the rate at which equilibrium was achieved. Results are due to the influence of ionic strength on the surface charge of retaining components and diffuse double layer thickness, along with effects of specific sorption of a divalent cation on surface charge, as they relate to P sorption rates. A support medium should reflect cation status as well as ionic strength of the system's aqueous phase. (Jahns-Arizona)

The change of Na, K, Ca and Mg in the precipitations after their penetration and transport through the soil was studied in a Douglas fir forest in Northwestern USA, by using tension lysimeters. The balance sheet of the 4 cations, moving in dissolved phase, was established for the whole ecosystem and the soil subsystem. The variations of the concentration of the soil solution at different depths was established. Some mechanisms are suggested for the solubility and for the transport of cations in forest soil. --Copyright 1974, Biological Abstracts, Inc.

A SURVEY OF THE PHYSICAL LIMNOLOGY OF GREAT SALT LAKE,
Utah Center for Water Resources Research, Logan.
A. Lin.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-256 210, $5.00 in paper copy, $3.00 in microfiche. Printed by Utah Division of Water Resources--Comprehensive Water Planning Program, Salt Lake City, (1976). 82 p, 18 fig, 1 tab, 22 ref, 3 append. OWRT A-029-UTAH(1). 14-31-0001-5045.

Descriptors: *Limnology, Lakes, Density flow, Seiches, Circulation, Mixing, *Stratification, Waves(Water), Diffusion, Currents(Water), Dispersion, Interfaces, *Great Salt Lake, *Utah, Surveys, Turbulent flow, Model studies.
Identifiers: *Lake currents, *Chemocline, *Physical limnology, Turbulent diffusion, Halocline oscillations.

This study summarizes some results of physical processes on the Great Salt Lake. Of some interest to limnologists is the meromixis (sustained two-layer stratification) in the south basin. The conspicuous two-layer was made possible by the presence of the railroad causeway. The stable stratification is demonstrated in the records of the last 15 years. The rate of entrainment of the chemocline obeys the general rules applicable to other large two-layer basins. The large-scale motion takes place more than 50 percent of the time. In the winter, the lake is calmer and most violent in late spring and early summer. The period of the fundamental surface wave was 6.0 hours on the record as compared to 5.43 hours obtained from a computation for the frictionless, rotationless Great Salt Lake. The discrepancy is accounted for by the effect of rotation and damping with a prognostic model. Time and space variations of the diffusion parameters are pronounced. The variation is attributable to the transient nature of the large-scale water movement frequently encountered, boundary influence from islands, spits or bars, and dynamics associated with the two-layer structure in the south basin. Oscillation of the halocline is substantial; typical period of oscillation is of the order of 35.0 hours, according to some preliminary field recordings.

PROCEEDINGS, SEVENTEENTH CONFERENCE ON GREAT LAKES RESEARCH, PART 1.
Proceedings of a Conference held August 12-14, 1974, McMaster University, Hamilton (Ontario). International Association for Great Lakes Research, Robert A. Sweeney, Treasurer, State University College, Great Lakes Laboratory, Buffalo, New York, 1974. 617 p.

Descriptors: *Great Lakes, *Limnology, *Water quality, *Biology, Aquatic life, Pollutants, Water pollution, Sediments, Sedimentation, Meteorology, Water temperature, Powerplants, Cooling water, Bacteria, Phytoplankton, Nutrients, Pesticides, Remote sensing, Model studies, Lakes.

The papers of this conference were grouped under the general headings of biology, geology/geochemistry, meteorology/hydrology, physical limnology, and water quality. A wide variety of research on the Great Lakes was reported. Many of the papers dealt with research related to the International Field Year for the Great Lakes (IFYGL), a North American contribution to the International Hydrologic Decade (IHD). The busi-

LIBRARY U. OF I. URBANA-CHAMPAIGN

ness meetings minutes, treasurer's report, bylaws, and membership list for the International Association for Great Lakes Research were included in this volume. (See W76-11276 thru W76-11324) (Sims - ISWS)

CRUSTACEAN ZOOPLANKTON OF SOUTHWESTERN LAKE ONTARIO IN 1972 DURING THE INTERNATIONAL FIELD YEAR FOR THE GREAT LAKES,
State Univ. Coll., Buffalo, N.Y. Great Lakes Lab.
S. C. Czaika.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 1-16, 1974. 3 fig, 2 tab, 39 ref. EPA R800701.

Descriptors: *Zooplankton, *Crustaceans, *Lake Ontario, *Great Lakes, Aquatic animals, Aquatic life, Aquatic microorganisms, Copepods, Shellfish, Surveys, Sampling, Biomass, On-site investigations, Lakes, Biology, Limnology.
Identifiers: *International Field Year for the Great Lakes.

The sampling matrix had seven transects perpendicular to shore running from Port Weller to Rochester with three stations in each transect at 1/2, 4, and 8 km from shore. Sampling was conducted during ten cruises from mid-April to mid-December, 1972. Copepod nauplii were the most abundant identification group followed by bosminids with mucro and immature cyclopoid copepodids. The other common identification groups in decreasing order of abundance were Daphnia retrocurva, Ceriodaphia lacustris, Cyclops biscuspidatus thomasi, Tropocyclops prasinus mexicanus, immature calanoid copepodids, and Eubosmina coregoni. With the exception of E. coregoni, these groups peaked in September and October. The common cladocerans exhibited the typical cladoceran pattern of winter and spring absence followed by very high maxima in late summer and early fall, especially closest to shore. Several species were encountered which have not been reported previously from Lake Ontario. Among these are perhaps three species of Alona, Camptocercus rectirostris, Eurycercus lamellatus, a species of Eucyclops, and five species of harpacticoid copepods (Bryocamptus nivalis, Canthocamptus robertcokeri, Canthocamptus staphylinoides, Mesochra alaskana, Moraria cristata). VERTICAL INTERACTIONS IN PHYTOPLANKTON POPULATIONS - AN ASYMPTOTIC EIGENVALUE ANALYSIS,
Manhattan Coll., Bronx, N.Y. Environmental Engineering and Science Graduate Program.
D. M. DiToro.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 17-27, 1974. 11 fig, 15 ref, 1 append. EPA R800610.

Descriptors: *Phytoplankton, *Plant populations, *Model studies, *Great Lakes, Aquatic populations, Aquatic plants, Biomass, Growth rates, Mathematical models, Analytical techniques, Buoyancy, Dispersion, Settling velocity, Lakes, Biology, Limnology.
Identifiers: *International Field Year for the Great Lakes.

An analysis of the one-dimensional vertical phytoplankton biomass equation indicated that if the population biomass is increasing, then asymptotically the log growth rate of the population will approach a value independent of depth. An examination of data from four bodies of water supported this theoretical prediction. For constant spatial variations of the parameters with the exception of an exponentially decreasing growth rate, the asymptotic growth rate of the population is related to the important dimensionless parameter groups. In particular, settling velocity effects were examined, together with their interactions with vertical dispersion, and euphotic zone depth. The results were presented in a series of dimensionless plots. (See also W76-11275) (Sims ISWS)
W76-11277

THE CRUSTACEAN ZOOPLANKTON OF GREEN BAY, LAKE MICHIGAN,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies
J. E. Gannon
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 28-51, 1974. 10 fig, 1 tab, 42 ref

Descriptors: *Zooplankton, *Crustaceans, *Bays, *Lake Michigan, *Great Lakes, Copepods, Aquatic life, Aquatic animals, Aquatic microorganisms, Rivers, Water pollution, Pollutants, Nutrients, Biomass, Surveys, Sampling, On-site investigations, Biology, Limnology.
Identifiers: *Green Bay(Wis).

Crustacean zooplankton were investigated in Green Bay during 1969-70. Thirty-four limnetic species and 12 littoral species were collected. Zooplankton community structure is similar in northern Green Bay, Little and Big Bay de Noc, and Lake Michigan. However, the zooplankton community is substantially different in southern Green Bay. The southeastern portion of the bay is strongly influenced by the inflow of nutrient-laden waters of the Fox River. Standing crop of zooplankton is generally higher in the zone of Fox River influence. Many species common in the plankton of Lake Winnebago are transported through the Fox River and have established populations in southern Green Bay. Many of these species are rare or absent elsewhere in the Lake Michigan basin. Many large species that have become rare in Lake Michigan in recent years due to size-selective predation by alewife are still abundant in Green Bay. The impact of fish predation by alewife and smelt on the larger zooplankton species appears to be buffered by recruitment of these zooplankters into the population both from higher rates of production in the eutrophic Green Bay waters and from dispersal of individuals into Green Bay from Lake Winnebago by way of the Fox River. LABORATORY ESTIMATES OF THE SEASONAL FINAL TEMPERATURE PREFERENDA OF SOME LAKE ERIE FISH,
Ohio State Univ., Put-in-Bay. Center for Lake Erie Area Research.
J. M. Reutter, and C. E. Herdendorf.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 59-67, 1974. 3 fig, 1 tab, 11 ref.

Descriptors: *Fish behavior, *Water temperature, *Thermal pollution, *Lake Erie, Temperature, Seasonal, Fish, Laboratory tests, Powerplants, Water pollution, Environmental effects, Lakes, Environmental effects, Biology.
Identifiers: *Water temperature preference.

Since June 1971, Ohio State University, in cooperation with the Ohio Department of Health and the U.S. Bureau of Sport Fisheries and Wildlife, has conducted experiments to determine the seasonal final temperature preferenda (Cont'd 5C)

Lake Erie fish of 24 species. Temperature preferenda ability were measured in a horizontal temperature gradient tank, seasonal by species season, and age. Fish were held at the temperature prior to testing. All species tested preferred temperatures above lake temperatures during fall, winter and spring. Summer temperature preferenda were approximately equal to or slightly higher than lake temperatures. Exceptions were necessary to fall, winter and spring values for species tested would have to be acclimated to warmer than they could tolerate in the wild. (See also W76-11275) (Sims ISWS)

MIGRATORY BEHAVIOR OF FISH TAGGED AT A NUCLEAR POWER PLANT DISCHARGE INTO LAKE MICHIGAN,
Argonne National Lab., Ill. Radiological and Environmental Research Div.
G. P. Romberg, S. A. Spigarelli, W. Prepejchal, and M. M. Thommes
In: Proceedings Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, International Association for Great Lakes Research, p 68-77, 1974. 6 fig, 3 tab, 14 ref

Descriptors: *Fish behavior, *Fish migration, *Thermal pollution, *Lake Michigan, Temperature, Water temperature, Fish, Freshwater fish, Trout, Lake trout, Salmon, Tagging, Environmental effects, Powerplants, Water pollution, Biology.
Identifiers: *Water temperature preference.

With the proliferation of nuclear power plants on Lake Michigan, much concern has been expressed over the effects of plume 'residence' and abnormal temperature exposures on the physiology and migratory behavior of important fish species. A mark and recapture study was conducted at the Point Beach Nuclear Plant to describe the migratory behavior of fish at this thermal discharge. A total of 1781 fish (7 species) were captured, tagged and released during 1972 and 1973. As of August 1, 1974, 14% of the tagged fish were recaptured, primarily by sport fisherman. Eighty-four percent of the recaptures by fishermen occurred at locations other than Point Beach, and the number or recaptures generally decreased with distance. Rainbow trout tended to be the most migratory, but individuals of each species showed extensive movements. Experimental temperature-sensitive fish tags indicated that the majority of fish recaptured at Point Beach spent less than 10% of their time at discharge temperature. Brown trout exhibited a stronger attraction to discharge waters than did rainbow trout or chinook salmon. High percentages of recapture for most species suggest negligible mortalities due to plume 'residence' or the tagging procedure and imply that Lake Michigan sport fishermen are annually harvesting a substantial proportion of the fish stocks. TEMPORAL AND SPATIAL DISTRIBUTIONS OF PLANKTONIC ROTIFERS IN MILWAUKEE HARBOR AND ADJACENT LAKE MICHIGAN,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
R. S. Stemberger.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 120-134, 1974. 16 fig, 1 tab, 24 ref.

Descriptors: *Rotifers, Harbors, *Lake Michigan, *Great Lakes, Plankton, Zooplankton, Sampling, Surveys, Seasonal, Spatial distribution, Benthic fauna, Temperature, Epilimnion, Biology, Limnology.
Identifiers: *Milwaukee(Wis).

Twenty-nine species of limnetic rotifers were prominent in the open waters off Milwaukee, Wisconsin, July 1972 to June 1973. Nine additional species were of rare or solitary occurrence. Eleven limnetic species were recorded for the first time in Lake Michigan. The predominant genera were Polyarthra, Keratella, Synchaeta and Notholca. Significant inshore-offshore differences in abundance and species composition were observed. The rotifer community in Milwaukee Harbor was composed mainly of benthic and littoral species as well as limnetic species characteristic of eutrophic waters. Pronounced vertical differences in distribution of species existed during thermal stratification. Rotifers were distributed during the late morning hours predominantly in the lower depths of the epilimnion and in the vicinity of the metalimnion. Currents and turbulence generated during high winds can distribute rotifers more uniformly throughout the epilimnion. The seasonal abundance of rotifers appears trimodal with two major peaks in July and September and a minor one in October. (See also W76-11275) (Sims - ISWS)

In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 150-157, 1974. 3 fig, 2 tab, 22 ref.

Descriptors: *Biota, *Radioisotopes, *Lake Michigan, Surveys, Sampling, Food chains, Water pollution, Pollutants, Analytical techniques, Nuclear wastes, Radioactive wastes, Plankton, Zooplankton, Phytoplankton, Algae, Benthic fauna, Fish, Chemistry, Biology, Limnology.
Identifiers: *Plutonium.

Samples of plankton, algae, benthic invertebrates, and eight fish species were collected from Lake Michigan during 1972 and 1973. After ashing, the samples were analyzed by radiochemical methods and gamma-ray spectrometry for Pu239, Sr90, and Cs137, all of which are components of fallout from atmospheric tests of nuclear weapons. Analyses indicated that Pu239 was scavenged from Lake Michigan water by phytoplankton and attached algae with a concentration factor of up to 10,000. In each of two food chains considered, a progressive discrimination against Pu239 was observed at successive trophic levels: (1) phytoplankton to zooplankton to planktivorous fish to piscivorous fish, and (2) benthic invertebrates to bottom-feeding fish. The benthic invertebrates and fish had somewhat higher Pu239 concentrations than their pelagic counter-parts, presumably because of their ingestion of sediments. Ash content was correlated with Pu239 concentrations in samples of plankton and fish. (See also W76-11275) (Sims - ISWS)

THE RADIATION BUDGET OF LAKE ONTARIO,
Center for the Environment and Man, Inc., Hartford, Conn.
M. A. Atwater.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 250-258, 1974. 9 fig, 3 tab, 8 ref. NOAA 2-35353, NSF GA-31296.

Descriptors: *Model studies, *Radiation, *Lake Ontario, Solar radiation, Infrared radiation, Heat budget, Albedo, Mathematical models, Computer models, Clouds, Water vapor, Carbon dioxide, On-site data collections, Atmosphere, Meteorology.
Identifiers: *International Field Year for the Great Lakes, *Radiation budget, Net radiation.

A horizontal array of 30 grid points was used to compute the radiation budget for Lake Ontario during the International Field Year of the Great Lakes (IFYGL). A weighted-average analysis method computed meteorological variables, including cloud amounts, at each grid point from surface observations. The radiation model was designed for accuracy, economy, efficiency and the inclusion of major physical processes that alter radiative fluxes. Downward and upward solar and infrared radiative fluxes were computed utilizing empirical transmission functions for absorbers, scatterers, and clouds. Observations taken during IFYGL were compared with time-integrated numerical results at selected sites. The differences are analyzed and changes in the numerical model were described. Results were presented for the net radiation balance for Lake Ontario during IFYGL and were compared with results based on observations. (See also W76-11275) (Sims - ISWS)

A STUDY OF LAKE-LAND BREEZE CIRCULATION OVER LAKE ONTARIO FROM IFYGL BUOY OBSERVATIONS,
National Oceanic and Atmospheric Administration, Washington, D. C. Center for Experiment Design and Data Analysis; and National Oceanic and Atmospheric Administration, Washington, D. C. Environmental Data Service.
J. K. S. Ching.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 259-268, 1974. 10 fig, 2 tab, 6 ref.

Descriptors: *Lake breezes, *Land breezes, *Air circulation, *Lake Ontario, Diurnal, Winds, Buoys, Temperature, Water temperature, Lakes, Atmosphere, Limnology, Meteorology.
Identifiers: *International Field Year for the Great Lakes, Divergence, Vorticity.

Data from both the United States and Canadian meteorological buoys were classified and averaged in terms of proximity to the northern, middle, and southern trisections of Lake Ontario. The diurnal variation of the averaged v wind component for these trisections was computed for a two week period in July 1972. A significant diurnal variation was found in all three cases, with the largest amplitude in the southern region. After subtracting the variations of the flow in the middle of the lake, which was assumed attributable to other scales of motion, from the northern and southern variations, a lake-land breeze circulation became apparent. The flow in the northern and southern sectors were almost in phase, of about equal magnitude (about 3/4 m/sec), and of opposite sign. The changes from land-to-lake and lake-to-land breeze occur at 10 a.m. and 10 p.m. local time, respectively. The variations in the computed vorticity, divergence, and curl of surface stress attributed to lake-land breeze circulation were discussed. (See also W76-11275) (Sims - ISWS)

TURBULENT KINETIC ENERGY BALANCE NEAR THE FROZEN SURFACE OF EASTERN LAKE ONTARIO,
York Univ., Downsview (Ontario). Dept. of Physics.
C. S. Maddukuri, and W. R. Frisken.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 288-295, 1974. 3 fig, 2 tab, 32 ref.

Descriptors: *Energy budget, *Energy transfer, *Ice, *Lake Ontario, Stability, Turbulence, Anemometers, Ice cover, Surfaces, Boundary layers, Lakes, Heat, Heat flow, Heat balance, Atmosphere, Meteorology, On-site investigations.
Identifiers: *International Field Year for the Great Lakes, Kinetic energy, Energy balance.

During February and March of 1973, direct measurements were made of turbulent fluxes of momentum and heat in the boundary layer using an ultrasonic anemometer mounted 2.67 m above the ice surface. These data were used to compute the kinetic energy balance in the boundary layer over the frozen water surface of Lake Ontario. Integrated statistics obtained in this study showed that the nature of the turbulence is similar to that observed at other sites over land and water. However, a plot of ratio of the variances of vertical and longitudinal velocity fluctuations against the stability parameter did not show any rapid transition as stability changes from stable to unstable. The values of various terms in the equation for the turbulent kinetic energy budget computed from the data were significantly less than those reported for studies over land and water surfaces. This is due to the smoothness of the ice surface and the light winds prevailing during the experiment. For nearly neutral conditions, the local production of turbulent energy is balanced by the local dissipation, in agreement with others. For unstable and slightly stable conditions the dissipation is not balanced by production. Very stable cases were not considered because of considerable anisotropy. (See also W76-11275) (Sims - ISWS)

GREAT LAKES TEMPERATURE MAPS BY SATELLITE,
National Environmental Satellite Service, Washington, D. C.
A. E. Strong.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 321-333, 1974. 14 fig, 8 ref.

Descriptors: *Remote sensing, *Temperature, *Great Lakes, Satellites(Artificial), Maps, Lake, Ice, Ice cover, Clouds, Water temperature, Infrared radiation, Instrumentation, Limnology.
Identifiers: *International Field Year for the Great Lakes, NOAA-2, *Temperature maps(Lakes).

Five case studies using Very High Resolution Radiometer data from the NOAA-2 satellite were presented. They demonstrated a capability for monitoring surface temperatures of the Great Lakes from space. Comparisons of this data with data available from more conventional sources were used to illustrate: (1) isothermal conditions, (2) thermal-bar circulations, (3) diurnal variability, and (4) summer upwelling. Examples presented showed the potential for using satellite observations routinely to monitor surface temperatures of the Great Lakes. (See also W76-11275) (Sims - ISWS)

NEARSHORE CURRENTS AND WATER TEMPERATURES ALONG THE NORTH SHORE OF LAKE ONTARIO BETWEEN PICKERING AND COBOURG,
Ontario HYDRO, Toronto. Hydraulic Studies Dept.
A. A. Arajs, and R. Farooqui.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 348-357, 1974. 10 fig, 2 tab, 3 ref.

Descriptors: *Currents(Water), *Water temperature, *Lake Ontario, *Great Lakes, Buoys, Current meters, Temperature, Lakes, Winds, Shores, On-site investigations, On-site data collections, Surveys, Sampling, Limnology.
Identifiers: *International Field Year for the Great Lakes.

In 1972 as part of Ontario Hydro's contribution to IFYGL and also in continuation of its hydrologic and environment studies, a program of lake current and water temperature measurements was carried out at four sites along a 100 km stretch of the north shore of Lake Ontario between Toronto and Cobourg. Current and temperature recorders were installed at various depths within a band of 2 km offshore and maintained from April to November. Results indicated that water movement was predominantly longshore all locations. Resultant transport was westward at all sites, except Pickering. Maximum current speeds were in the order of 30 cm/sec. Water temperatures indicated similarity at all sites; surface warming in spring, complete stratification including up- and down-welling in summer, and isothermal conditions in fall. (See also W76-11275) (Sims - ISWS)

POINT PETRE STORM SURGES SIMULATION,
Department of the Environment, Ottawa (Ontario). Marine Environmental Data Service; and Department of the Environment, Ottawa (Ontario). Ocean and Aquatic Affairs.
P-A. Bolduc.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 358-368, 1974. 11 fig, 3 ref.

Descriptors: *Model studies, *Storm surge, *Lake Ontario, Mathematical models, Statistical models, Winds, Wind velocity, Wind tides, Surges, Waves(Water), Seiches, Water levels, Water level recorders, Water level fluctuations, Limnology.
Identifiers: *Point Petre(Ontario).

Frequency distribution of water level differences between on shore and off shore measurements were illustrated and analyzed from July to December 1971 for Point Petre on Lake Ontario. The technique enabled a quality check on the off shore water level measurement, the critical part of the data. Positive differences between the on shore and off shore measurements suggested water level set-up during storm activities. Six different storm periods (A through F) were presented. Correlation of the wind with the resultant water level difference was quite high (minimum value being 0.72). Using storm A for calibration, two different models were proposed to simulate the water set-up from the wind data for storms B through F. The first model is a mathematical model. The largest and smallest root mean square value of the differences between the observed and predicted set up for this type of model were respectively 0.087 m for storm B and 0.050 m for storm F. The second model is a statistical model based on linear regression. A polynomial equation of the sixth order was defined from storm A. The fit between the observed and predicted water level differences (set up) for the five storms was improved using the polynomial equation. The maximum and minimum root mean square values were 0.061 m for storm C and 0.039 m for storm D. The type of phenomenon observed at Point Petre suggests that on shore water level measurements do not give a real picture of the mean water level of the lake (a value used for regulation) during storm activities, the build-up of the water being mainly a shore process. GENERALIZED PROFILES OF WIND SPEED, TEMPERATURE AND HUMIDITY,
Canada Centre for Inland Waters, Burlington (Ontario).
M. A. Donelan, K. N. Birch, and D. C. Beesley.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 369-388, 1974. 14 fig, 16 ref.

Descriptors: *Wind velocity, *Temperature, *Humidity, *Lake Ontario, Measurement, Instrumentation, Towers, Winds, Air temperature, On-site investigations, On-site data collections, Data processing, Analytical techniques, Lakes, Shores, Atmosphere, Stability, Boundary layers, Meteorology.
Identifiers: *Over-water measurements, Wind profiles, Temperature profiles.

Throughout the four boundary layer active periods of the IFYGL, ten minute averaged profiles were measured from a tower off Niagara-on-the-Lake. This paper described the measurement system and summarized the profiles by a set of non-dimensional functions of stability which would allow one to construct profiles knowing only the air-water differences of the three primary stability determining paramenters: wind speed, temperature and humidity. HELMHOLTZ RESONANCE IN HARBOURS OF THE GREAT LAKES,
Canada Centre for Inland Waters, Burlington (Ontario).
N. G. Freeman, P. F. Hamblin, and T. S. Murty.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 399-411, 1974. 9 fig, 1 tab, 9 ref.

Descriptors: *Resonance, *Harbors, *Model studies, *Great Lakes, Waves(Water), Mathematical models, Analytical techniques, Lakes, Bays, Hydrodynamics, Hydraulics, Limnology.
Identifiers: *Helmholtz resonance.

Helmholtz resonance basically represents the balance between the kinetic energy of the water

flowing in through a narrow connecting channel, and the potential energy from the rise in mean water level within the harbor. It is an additional gravitational mode of substantially longer period than fundamental free oscillation and can be significant in the contamination of spectra of water levels collected in harbors and in the consideration of harbor flushing times. Theoretical estimates for the Helmholtz periods for an idealized multi-channel basin were computed by means of a multi-degree of freedom resonator and for a more realistic geometry by means of a numerical model. Power spectral analysis of water level records measured during the IFYGL study compared favorably with the theoretical predictions for the Toronto and Hamilton harbors. The Helmholtz resonator model is less satisfactory in dealing with bays with complicated entrance geometry, and it was demonstrated that a co-oscillation model is more appropriate. VERTICAL MIXING CHARACTERISTICS IN THE THERMOCLINE AND HYPOLIMNION REGIONS OF LAKE ONTARIO,
Copenhagen Univ., Denmark. Inst. of Physical Oceanography.
G. Kullenberg, C. R. Murthy, and H. Westerberg.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 425-434, 1974. 7 fig, 2 tab, 20 ref.

Descriptors: *Mixing, *Thermocline, *Hypolimnion, *Lake Ontario, Tracer, Dye releases, Fluorescent dye, Temperature, Water temperature, Energy dissipation, Lakes, On-site investigations, Hydrodynamics, Limnology.
Identifiers: *International Field Year for the Great Lakes, Vertical mixing.

The instantaneous point-source, sub-surface dye diffusion experiments carried out during the IFYGL were used to study the small-scale vertical mixing in relation to the vertical temperature and current structure. The experiments covered time scales from 5 to 80 hours as well as a wide range of environmental conditions. In the vertical direction, the dye distribution exhibited a layered structure which apparently is related to the density and current structures in the water column. Several types of dye layers were observed. The close relation between the dye distribution and the small-scale temperature structure was shown, and possible layer generating mechanism were discussed, such as advective processes, wave generated overturning instabilities, and shear instabilities. The effective vertical mixing coefficient, as determined by means of the dye profiles, was found to vary considerably. It falls in the range 0.01.5 sq cm/sec. The persistency of the dye layers alone shows that the mixing can be extremely weak. The results also suggested that the mixing depends upon the density stratification, the vertical current shear, and the fluctuating kinetic energy. A relationship to this effect was suggested based on Lake Ontario and oceanic data. The energy dissipation per unit mass and time was estimated by means of the dye profiles at depths around 30 m. It was found to be of the order of 0.000061 sq cm/sec to the 3rd power. This value is one to two orders of magnitude smaller than values reported from corresponding depths in the ocean. (See also W76-11275) (Sims - ISWS)
W76-11308

DURATION-LIMITED WAVE SPECTRA IN LAKE ONTARIO DURING THE 1972 HURRICANE AGNES,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
P. C. Liu.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 435-444, 1974. 7 fig, 6 ref.

Descriptors: *Waves(Water), *Hurricanes, *Lake Ontario, Winds, Wind velocity, Wind tides, Buoys, On-site investigations, Measurement, Lakes, Energy, Storms, Limnology.
Identifiers: *Hurricane Agnes, Wave spectra, Waverider buoys.

Analyses of hourly wave spectra during the hurricane Agnes, 22-23 June 1972, from two waverider recordings at Oswego-1 and Oswego-2 buoys in Lake Ontario showed that the growth and decay of significant wave heights follow in approximately linear pattern with time during respectively increasing and decreasing wind speed. An initial growth of wave spectra from a relatively calm condition is quite rapid and abrupt and the growth rate is not linear. The development of individual spectral components can be grouped into three spectral ranges: low frequency range where the components are most sensitive to wind, a high frequency range where the components are generally independent of time or wind stress, and a middle frequency range possesses both high and low frequency range properties. VERTICAL MOTIONS ALONG THE NORTH SHORE OF LAKE SUPERIOR,
Wisconsin Univ., Madison. Marine Studies Center.
R. A. Ragotzkie.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 456-461, 1974. 3 fig, 1 tab, 5 ref.

Descriptors: *Upwelling, *Lake Superior, *On-site investigations, Measurement, Currents(Water), Temperature, Water temperature, Lakes, Winds, Shores, Coasts, Circulation, Water circulation, Movement, Limnology.
Identifiers: *Vertical motions.

A ten-day upwelling episode in deep water along the north shore of Lake Superior was documented by means of continuous temperature records at nine levels and horizontal currents at three levels. Wind observations at the nearest onshore point were also included. Vertical motions in the water column started below the 150 m level and did not extend to near surface levels until the fifth day. Vertical velocities reached 30 m per day during part of the episode. Upwelling occurs once or twice each month during the period of thermal stratification in this region. Due to their magnitude these motions must play a significant role in the vertical transport of nutrients and plankton of the lake and may be an important factor in maximizing the potential productivity of the lake. MEAN MONTHLY SURFACE TEMPERATURES OF LAKE ONTARIO FROM APRIL 1972 TO MARCH 1973,
Atmospheric Environment Service, Toronto (Ontario). Lakes and Marine Applications Section.
W. S. Webb.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 471-482, 1974. 13 fig, 1 tab, 13 ref.

Descriptors: *Water temperature, *Remote sensing, *Lake Ontario, Surveys, Temperature, Lakes, Seasonal, Monthly, Aircraft, Instrumentation, Climatology, Measurement, Limnology.
Identifiers: *International Field Year for the Great Lakes, Surface temperature.

From April 1972 through March 1973 inclusive, 47 airborne radiation thermometer surveys of the surface temperature of Lake Ontario were made by the Atmospheric Environment Service. A mean surface temperature was determined for each month as well as maps of spatial variations. Lake surface temperatures were found to be cooler than the corresponding 1966-71 normal values in all but three months. On three occasions (June, July, and October) surface temperatures were about 2 C below the normal. In all months, mean spatial patterns of surface temperatures closely resembled those of the normal. In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 549-573, 1974. 14 fig, 4 tab, 16 ref.

Descriptors: *Water quality, *Surveys, *Lake Superior, On-site investigations, Pollutants, Pollutant identification, Dissolved oxygen, Suspended solids, Water temperature, Chlorophyll, Coliforms, Streptococcus, Heavy metals, Chlorides, Nitrogen, Phosphorus, Chemicals, Turbidity, Shores, Harbors, Measurement, Sampling, Limnology.

Up-to-date and accurate information about existing water quality characteristics is necessary for any future planning or management of the Great Lakes environment. Four cruises on the nearshore waters of Lake Superior were carried out during the late summer and fall of 1973 to provide a systematic water quality monitoring of the Ontario shoreline of the lake. This study generated extensive physical, chemical, and bacteriological data on 67 stations along the north shore of the lake from Whitefish Bay to Thunder Bay. In addition to this, intensive water quality studies were undertaken in the following confined areas where industrial and municipal discharges have contributed to impairment: Peninsula Harbour, Jackfish Bay, Nipigon Bay, and Thunder Bay. A comparison was made of water quality in nearshore and harbor areas including an examination of dissolved oxygen, suspended and dissolved solids, conductivity, turbidity, nitrogen, phosphorus, phenols, alkalinity, chloride, sulphate, pH, heavy metals, dissolved silica, water temperature, chlorophyll a, total and fecal coliforms, and fecal streptococci. Extensive bottom sediment studies were incorporated in the survey program to determine the regions of accumulations of heavy metals, nutrients, pesticides, phthalates, and organic matter. Generally, the overall quality of the nearshore waters of Lake Superior is high and the values of important parameters are well within the limits prescribed by the Ontario Ministry of the Environment for all uses. These waters do not appear to have been adversely affected as yet by the urban and industrial development which has caused significant localized impairment. (See also W76-11275) (Sims - ISWS)

VERTICAL DISTRIBUTION PATTERNS OF GOLDEYE, HIODON ALOSOIDES, IN FORT PECK RESERVOIR, MONTANA,
Kaniksu National Forest, Sandpoint, Idaho.
J. L. Cooper.
U S Nat Mar Fish Serv Fish Bull. 71(2); p 473-478, 1973.

Descriptors: *Distribution patterns, *Montana, Reservoirs, Seasonal, Temperature, Water temperature.
Identifiers: *Goldeye, Hiodon-Alosoides, *Vertical distribution patterns, Fort Peck reservoir(Mont).

In Nov. 1967 and continuing into Dec. 1969, the goldeye, H. alosoides (Rafinesque), in Fort Peck Reservoir, Montana, exhibited seasonal vertical distribution patterns, which seemed to be related to the surface-water temperature. When surface-water temperatures were above 8.9C (summer and early fall), the goldeye congregated near the surface. During the late fall, ice-covered period, and spring when surface temperatures varied between 8.9 and 1.1C, the goldeye usually congregated between the 8- and 32-ft level. It is suggested that the goldeye were following the food source and were not responding to temperature per se.--Copyright 1973, Biological Abstracts, Inc.

A NUMERICAL MODEL OF THE TIME-DEPENDENT, THREE-DIMENSIONAL STRUCTURE OF CIRCULATION IN LARGE LAKES.
Geological Survey, Menlo Park, Calif.
R. T. Cheng.
Meeting Preprint 2692 for presentation at American Society of Civil Engineers National Water Resources and Ocean Engineering Convention, held in San Diego, California, April 5-8, 1976. 27 p, 8 fig, 25 ref.

Descriptors: *Model studies, *Numerical analysis, *Water circulation, *Lakes, Winds, Lake morphology, Lake morphometry, Lake shores, Bathymetry.

A mixed analytical and numerical transient circulation model is proposed. A three-dimensional circulation structure can be calculated by solving a system of depth-averaged, two-dimensional conservation equations and by evaluation of the formal solutions. Large-scale movement of water in lakes is considered. Wind stress imposed on the free surface is the primary source of momentum and energy. Due to relatively small size (when compared with the open ocean), the circulation is strongly dependent upon the lake-basin morphology. Thus, accurate representation of the basin's shoreline and bathymetry is essential. (Woodard-USGS)

PROCEEDINGS, SEVENTEENTH CONFERENCE ON GREAT LAKES RESEARCH, PART 2.
Proceedings of a conference held August 12-14, 1974, McMaster University, Hamilton (Ontario). International Association for Great Lakes Research, c/o Robert A. Sweeney, Treasurer, State University College, Buffalo, New York, Great Lakes Laboratory, 1974. 232 p.

Descriptors: *Great Lakes, *Limnology, *Water quality, *Biology, *Lake Ontario, Aquatic life, Water pollution, Sediments, Sands, Water temperature, Model studies, Lakes, Nutrients, Phytoplankton, Bacteria, Biomass, Pollutants, Meteorology, Atmosphere, Optical properties, Winds, Wind tides, Forecasting, Clouds.
Identifiers: *International Field Year for the Great Lakes.

The papers were grouped under the general headings of biology, chemical limnology, geology/geochemistry, meteorology/hydrology, physical limnology, and water quality. A wide variety of research on the Great Lakes was reported. Many of the papers dealt with research related to the International Field Year for the Great Lakes (IFYGL), a North American contribution to the International Hydrologic Decade (IHD). A subject index for both parts of this proceedings was included in this volume. (See W76-11425 thru W76-11442) (Sims-ISWS)

THE ABUNDANCE OF DIATOMS IN THE SOUTHWESTERN NEARSHORE REGION OF

LAKE ONTARIO DURING THE SPRING THERMAL BAR PERIOD,
State Univ. of New York Coll. at Buffalo. Great Lakes Lab.
G. J. Lorefice, and M. Munawar.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 619-628, 1974. 3 fig, 4 tab, 25 ref. EPA 800701.

Descriptors: *Diatoms, *Phytoplankton, *Lake Ontario, Surveys, Sampling, Plankton, Aquatic microorganisms, Temperature, Water temperature, Biomass, Aquatic life, Silica, Nitrogen, Phosphorus, Nutrients, Shores, Lakes, Limnology, Biology.
Identifiers: *Thermal bars.

As part of the IFYGL program an intensive study was carried out during April and May 1972 in the nearshore region of Lake Ontario. Water samples were collected from 45 stations on the southwestern nearshore area of Lake Ontario at 1/2, 4 and 8 kms from the shore. Using the Utermohl technique, phytoplankton was analyzed qualitatively and quantitatively. During the investigation period the thermal bar remained within the study area. In April it stayed shoreward of the 4 kms stations, dipping into and out of the shore. By May it had advanced farther out but in most cases to less than 8 kms. Total phytoplankton biomass along with diatoms, particularly Melosira binderana Kutz. showed high concentrations on the nearshore side of the thermal bar. This observation may be related to temperature and the concentration of nutrients in the nearshore region. Diatoms accounted for 58% of the biomass in April and 48% in May. During April Surirella angustata Kutz., Rhodomonas minuta Skuja and Peridinium aciculiferum (Lemm.) Lemm. were the most common species while M. binderana Kutz., P. aciculiferum, and Melosira islandica ssp. helvetica O. Muller were common in May. (See also W76-11424) (Sims-ISWS)

A PRELIMINARY STUDY ON THE OCCURRENCE AND DISTRIBUTION OF GEOFUNGI IN LAKE ONTARIO NEAR THE NIAGARA RIVER,
Canada Centre for Inland Waters, Burlington (Ontario).
A. A. Qureshi, and B. J. Dutka.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 653-662, 1974. 3 fig, 5 tab, 48 ref.

Descriptors: *Fungi, *Aquatic fungi, *Lake Ontario, Sampling, Surveys, Pollutant identification, Water pollution, Rivers, Lakes, Laboratory tests, Analytical techniques, Coliforms, Streptococcus, Pollutants, Nutrients, Bacterica, Indicators, Limnology, Bioindicators.
Identifiers: *Niagara River(NY), *Geofungi.

The occurrence, distribution and relative abundance of geofungi in water samples, collected from Lake Ontario near the mouth of the Niagara River, were examined to determine their relationship to other water pollution indicator parameters. The results suggested a relationship between geofungi and certain physical, chemical and bacteriological parameters. The significance of the presence of geofungi in aquatic environment and their possible use as water pollution indicator organisms were discussed. (See also W76-11424) (Sims - ISWS)

BACTERIAL POPULATIONS IN LOWER GREEN BAY,
Wisconsin Univ. Green Bay, Coll. of Environmental Sciences.
L. J. Schwartz.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 663-667, 1974. 1 fig, 3 tab, 9 ref.

Descriptors: *Bacteria, *Water pollution, *Bays, *Lake Michigan, Rivers, Lakes, Sampling, Surveys, Coliforms, Streptococcus, Sewage, Sewage effluents, Sewage bacteria, Pollutants, Sewage treatment.
Identifiers: *International Field Year for the Great Lakes, *Green Bay(Wis), *Fox River(Wis).

A study was undertaken to determine bacterial densities in lower Green Bay. Water samples were collected monthly from a relatively fine grid sampling network covering approximately 25 sq km of the lower bay. Standard bacteriological techniques were employed to isolate total and fecal coliform, fecal streptococci, and total bacteria (plate count). Results indicated that the major source of bacterial input into lower Green Bay is via the Fox River. A large contributor to this bacterial load is the effluent discharge of a 20 mgd sewage treatment plant near the mouth of the river. Highest bacterial densities were obtained at the mouth of the river with decreasing densities as the distance increased from the river's mouth. Fecal coliform counts ranged in the hundreds of thousands per 100 ml at some locations. Fecal coliform--fecal streptococci ratios often exceeded four, indicative of human fecal contamination. IFYGL CHEMICAL INTERCOMPARISONS,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
A. Robertson, F. C. Elder, and T. T. Davies.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 682-696, 1974. 8 tab, 5 ref.

Descriptors: *Sampling, *Water chemistry, *Analytical techniques, *Great Lakes, Surveys, Chemistry, Laboratory tests, *Chemical analysis, Ships, Lakes, Nutrients, Chemicals, Metals, Turbidity, Analysis, *Pollutant identification, Water pollution, Limnology.
Identifiers: *International Field Year for the Great Lakes.

During the IFYGL program three separate intercomparisons of chemical determinations were conducted. In the first study, samples of known concentration for a number of properties were sent for analysis to several laboratories. Statistical evaluation of the results from these determinations showed that, except for sodium, there was little evidence that the means for the laboratory determinations differed from the comparable known concentrations. However, the results of this study did indicate that, for most of the properties, there were systematic differences among the results from the participants. In the second study, samples were obtained at four depths at each of two stations and each sample was split into four parts. For one of these a number of determinations were conducted immediately on the vessel. The other three subsamples were frozen and sent to three of the major IFYGL laboratories, and the same analyses were conducted as aboard the ship. This procedure was carried out five different times. Analysis of the results showed statistically significant differences among the results from the three laboratories for many of the parameters. In the third study, several of the vessels involved in IFYGL were brought together and similar sampling programs were carried out on each. Series of replicate samples were obtained by each vessel and one of the replicates was analyzed by each of the three participating laboratories. The data for this work indicated that differences in sampling methods among the vessels probably have a relatively minor effect on the results obtained. (See also W76-11424) (Sims - ISWS)

CLOUD ANALYSIS AND DIAGNOSIS OVER LAKE ONTARIO AND VICINITY,
Center for the Environment and Man, Inc. Hartford, Conn.
J. T. Ball.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 704-712, 1974. 7 tab, 5 ref. NOAA 2-35353

Descriptors: *Clouds, *Lake Ontario, *Forecasting, Correlation analysis, Temperature, Air temperature, Humidity, Atmosphere, Solar radiation, Lakes, Seasonal, Meteorology.
Identifiers: *International Field Year for the Great Lakes, Middle clouds, High clouds.

The computation of the radiation budget of Lake Ontario requires a reasonably accurate analysis of the horizontal and vertical distribution of cloudiness. Results have shown that radiative fluxes computed at the surface are highly sensitive to cloud amount. Objective analyses of low, middle, and high cloud amount were obtained at three-hourly intervals during the period April 1972 through March 1973. Possible lake effects on low cloud amount were investigated during the July 1972 to November 1972 period, and statistical relationships were derived. Serious errors can be introduced into solar radiation computations during periods of persistent, extensive, low cloud overcast due to errors in estimating the amount of middle and high clouds. During the IFYGL, observations of middle and high cloud amount were completely lacking about 10% of the time. To alleviate this problem, a study was conducted to develop diagnostic procedures to estimate middle and high cloud amount above a low overcast. Multiple linear regression equations were developed relating middle and high cloud amount to predictors derived from Buffalo radiosonde observations taken on OOGMT and 12GMT. The predictors were mainly temperature and moisture dependent variables between the 850- and 400-mb constant pressure surfaces. Equations were developed for the entire sample of 597 cases and for seasonal stratifications of the sample. The diagnostic results obtained were shown to be superior to assuming conditions of clear, overcast or climatological averages for upper-level cloud amounts. (See also W76-11424) (Sims - ISWS)

LIBRARY U. OF I. URBANA-CHAMPAIGN

PRELIMINARY ENERGY BUDGET OF LAKE ONTARIO FOR THE PERIOD MAY THROUGH NOVEMBER, 1972,
Canada Centre for Inland Waters, Burlington (Ontario).
F. C. Elder, F. M. Boyce, and J. A. Davies.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 713-724, 1974. 8 fig, 2 tab, 15 ref.

Descriptors: *Energy budget, *Thermal radiation, *Lake Ontario, Solar radiation, Temperature, Water temperature, Evaporation, Radiation, Albedo, Heat transfer, Heat budget, Heat balance, Lakes, Energy, Heat, Latent heat, Limnology.
Identifiers: *International Field Year for the Great Lakes.

Measurements were made during the International Field Year for the Great Lakes which permit calculation of the thermal energy budget for Lake Ontario for the April to December period. A network of meteorological measurement stations provided data from which latent and sensible heat flux were calculated. Global solar and long-wave radiation measurements allowed assessment of the net radiation balance. Approximate bi-weekly intensive temperature surveys provided for independent computation of the lake heat storage. Over the period for which measurements were available, the measured heat storage exceeded the value calculated from the energy budget by over 8000 cal/sq cm. This amounts to difference of 33 cal/sq cm/day or approximately 5% of the maximum daily flux. Analysis of the possible error in each of the budget terms indicated that the net radiation calculations are most likely the largest contributor. The incoming long-wave radiation estimates are least subject to verification and are believed to contain the greatest degree of uncertainty. (See also W76-11424) (Sims - ISWS)

GREAT LAKES WIND FORECASTS BASED ON MODEL OUTPUT STATISTICS,
National Weather Service, Silver Spring, Md. Techniques Development Lab.
D. M. Feit, and C. S. Barrientos.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 725-732, 1974. 4 fig, 4 ref.

Descriptors: *Winds, *Forecasting, *Great Lakes, Computer models, Mathematical models, Computer programs, Stability, Temperature, Boundary layers, Atmosphere, Lakes, Meteorology.
Identifiers: *Wind forecasting, Forecasting models.

An automated objective method to forecast the maximum steady winds at twelve locations over the five Great Lakes has been developed for routine use by the National Weather Service. The developmental approach is statistical in nature and is based on the Model Output Statistics (MOS) technique. This technique matches the output from a numerical model (predictors) with observations (predictands) and computes a prediction equation. The predictors are various forecast elements computed by the National Meteorological Center's Primitive Equation (PE) model. The predictands are wind observations taken by vessels operating on the Great Lakes. A multiple regression screening program was used to derive the prediction equations. Multiple correlation coefficients of .83 to .40 were obtained between predictors and predictands. Separate sets of equations were derived for each of six forecast periods out to 36 hours. For each period, a set of three equations was derived consisting of U- and V-components and wind speed equation. Distinct sets of equations were developed for the summer and winter seasons and for the 0000 GMT and 1200 GMT PE model origin times. User stations have indicated that the forecasts are useful and synoptically reasonable. (See also W76-11424) (Sims - ISWS)

OBJECTIVE ANALYSIS OF IFYGL SURFACE METEOROLOGICAL DATA,
National Oceanic and Atmospheric Administration, Washington, D. C.
J. B. Jalickee, J. K. S. Ching, and J. A. Almazan.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 733-750, 1974. 17 fig, 12 ref.

Descriptors: *Data processing, *Meteorological data, *Lake Ontario, Computer programs, Analytical techniques, Air temperature, Water temperature, Winds, Humidity, Weather, Mathematics, Mathematical models, Lakes, Meteorology.
Identifiers: *International Field Year for the Great Lakes, Objective analytical techniques.

An objective analysis scheme has been developed for the analysis of IFYGL data. Observed values of a given meteorological field were fitted to a model consisting of polynomials in the space-time variables in the sense of generalized least squares. Orthogonal polynomials, formed accurately from base polynomials by a Gram-Schmidt reorthogonalization procedure, were used to effect the least-squares fit. Meteorological data from the Canadian buoys and the U. S. buoys and towers were analyzed for two time periods by means of the objective analysis technique. The two periods chosen were 7 to 21 July and 1 to 10 October 1972. The former was characterized by near-neutral atmospheric conditions, the latter by unstable conditions. Objective analyses were done of air temperature, surface temperature, wind, and humidity in order to obtain area averages for Lake Ontario. Similarly, area averages were computed of estimates of momentum, heat, and water-vapor surface fluxes derived by the bulk aerodynamic method. Fields of the lateral and longitudinal wind components and of vorticity and divergence were presented. The results of these analyses were evaluated with respect to synoptic conditions and were also compared with results obtained by the station-averaging method. (See also W76-11424) (Sims - ISWS)

THE ATMOSPHERIC BUDGETS PROGRAM OF IFYGL,
National Oceanic and Atmospheric Administration, Washington, D. C. Environmental Data Service.
E. M. Rasmusson, H. L. Ferguson, J. Sullivan, and J. den Hartog.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 751-777, 1974. 18 fig, 5 tab, 25 ref.

Descriptors: *Heat budget, *Water vapor, *Lake Ontario, Atmosphere, Analytical techniques, Lakes, Evaporation, Winds, Air temperature, Humidity, Data processing, Heat transfer, Weather, Weather data, Meteorological data, Limnology, Meteorology.
Identifiers: *International Field Year for the Great Lakes, *Atmospheric budgets, Objective analytical techniques.

The water vapor and heat budgets of the atmosphere over Lake Ontario was evaluated to obtain estimates of average lake evaporation for periods on the order of a week. Data for this project were obtained during September-December 1972 from a six-station network of LORAN-C rawinsonde stations located along the perimeter of the lake. The design of the experiment and results of the field program were reviewed. Unexpected errors in the LORAN C time delay data required a significant sacrifice of vertical resolution in the processed wind data. However, the relatively high time and vertical resolution of the temperature and humidity data revealed the detailed structure of these fields to a degree not attainable with routine operational data. A set of conservation equations, suitable for budget analyses over Lake Ontario, was derived. Special attention was given to the possibility of phase change between liquid, solid, and vapor states, and problems arising when the flux of condensed moisture across the shoreline is significant. A budget analysis scheme was discussed in which the meteorological fields are represented in terms of a set of orthoganal functions in time and space. Examples of fitted wind and humidity fields were presented. (See also W76-11424) (Sims - ISWS)
W76-11436

DETERMINATION OF THE AERODYNAMIC DRAG COEFFICIENT FROM WIND SET-UP,
Canada Centre for Inland Waters, Burlington (Ontario).
M. A. Donelan, F. C. Elder, and P. F. Hamblin.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 778-788, 1974. 5 fig, 1 tab, 20 ref.

Descriptors: *Wind tides, *Drag, *Lake Ontario, Winds, Stress, Stability, Atmospheric pressure, Water levels, Lakes, Currents(Water), Water temperature, Seiches, Rotations, Tides, Waves(Water), Wave pile-up, Fluid mechanics, Limnology.
Identifiers: *International Field Year for the Great Lakes.

The estimation of wind stress from the steady state water set-up of an enclosed water body is fraught with uncertainties arising primarily from measurement errors of the overall wind field and the water level in the presence of shoaling waves. During the IFYGL there were several accurate water level recording gages installed around Lake Ontario, and the wind field was monitored continuously at a score of stations across the Lake. In addition, a 'deep water' gage was installed off Niagara-on-the-Lake. This gage was compared with nearby gages in shallower water to assess the effect of wave set-up on the water level measurement in shallower water. This was concluded that the difference in water level between Burlington and Oswego is probably accurate for eastward surface stress. The effects of atmospheric pressure, tides and seiches were removed and the error due to bottom stress was shown to be small. Finally the corrected and filtered water levels were correlated with the lake-wide average stress and drag coefficient deduced for unstable and neutral atmospheric boundary layers. The drag coefficient obtained from the data points without regard to stability was 0.00135; that for neutral conditions was smaller, and unstable conditions larger. (See also W76-11424) (Sims - ISWS)
W76-11437

SHORT PERIOD TIDES IN LAKE ONTARIO,
Canada Centre for Inland Waters, Burlington (Ontario).
P. F. Hamblin.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 789-800, 1974. 8 fig, 3 tab, 12 ref.

Descriptors: *Tides, *Lakes, *Lake Ontario, Circulation, Water circulation, Model studies, Mathematical models, Equations, Diurnal, Water level, Hydrodynamics, On-site investigations, Limnology.
Identifiers: *International Field Year for the Great Lakes.

The diurnal and semidiurnal tides of Lake Ontario were simulated numerically by means of a numerical hydrodynamical model in which only the spacial derivatives are discretized. The semianalytical model predicted a direct response for both tidal constituents, that is, in the direction of rotation of the tidal generating force. The sense of rotation was cum sole for the semidiurnal oscillation and in the opposite sense for the diurnal tide. Maximum predicted amplitudes of 12.1 mm occurred at the western extremity of the lake for the semidiurnal tide and 5.2 mm at the same location for the diurnal tide. The main feature of the predicted response, that the semidiurnal tide rotates in a clockwise direction was corroborated by the observations at 16 tidal gages around the lake. An amphidromic point in both the model and prototype was located at a mid-lake position to the north of Rochester. The tidal solutions were relatively insensitive to bottom friction which does not reasonably account for the fact that the observed amplitudes are 70% of the theoretical amplitudes. This discrepancy was well explained by the effect of the earth tide and was in close agreement with measurements of the earth tide found in the literature. (See also W76-11424) (Sims - ISWS)
W76-11438

TRANSIENT THERMAL RESPONSE OF LARGE LAKES TO ATMOSPHERIC DISTURBANCES,
Hydronautics Inc., Laurel Md.
T. R. Sundaram.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 801-810, 1974. 4 fig, 19 ref.

Descriptors: *Thermal properties, *Thermocline, *Model studies, *Lakes, Thermal stratification, Seasonal, Temperature, Water temperature, Mixing, Heat, Winds, Energy, Mathematical models, Laboratory tests, On-site investigations, Limnology.
Identifiers: *Thermal bar.

A length scale which is a measure of the relative magnitudes of the fluxes of thermal and wind-induced mixing energies at the surface of a lake was used to describe the transient thermal response of a lake to changes in atmospheric condition above it. This length scale was used previously to describe the seasonal stratification cycle. Two specific transient phenomena were considered here as examples, namely, thermocline erosion due to a sudden storm and the thermal bar. The rate of downward erosion of the thermocline due to a storm was calculated in terms of the wind conditions and the results are compared with those of existing laboratory experiments. A theoretical model was also developed for the formation, evolution and ultimate disappearance of the thermal bar. The results were again compared with available laboratory and field data. W76-11439

OPTICAL PROPERTIES OF THE GREAT LAKES,
Canada Centre for Inland Waters, Burlington (Ontario).
K. P. B. Thomson, J. Jerome, and W. R. McNeil.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 811-822, 1974. 12 fig, 1 tab, 8 ref.

Descriptors: *Optical properties, *Lake Ontario, *Great Lakes, *Lake Superior, *Lake Erie, On-site investigations, Model studies, Statistical models, Light, Solar radiation, Turbidity , Water properties, Physical properties, Analytical techniques, Lakes, Chlorophyll, Limnology.
Identifiers: *Optical transmittance, Organic particles.

During the IFYGL, a series of in situ optical measurements were carried out as part of the Lake Ontario Organic Particle Study. The principal optical measurement made during each cruise was the downwelling irradiance of sunlight, from 400-700 nm, as a function of depth. These data were used to investigate the optical characteristics of Lake Ontario in terms of the spectral transmittance of the downwelling irradiance. Similar measurements from Lake Erie and Lake Superior were analyzed and compared with the Lake Ontario data. The analysis and intercomparison of the data for the three Great Lakes was based on Vollenweider's statistical model of the extinction coefficient. Significant deviations from Vollenweider's standard distribution could be identified as differences in the optical characteristics of a lake resulting from the limnological properties of the particular water body. Comparison of the extinction and the linear regression coefficients obtained from the Great Lakes to the standard distribution showed significant deviations in the blue (430 nm) and red (630 nm) regions of the spectrum. These differences were interpreted to mean that the Laurentian Great Lakes contain appreciable amount of humic substances; this was substantiated by laboratory absorption measurements on filtered samples. The data also showed that the seasonal variations of the mean vertical extinction coefficient delineate clearly the physical and biological changes in the lakes. The mean vertical extinction coefficient can be used as a gross indicator of the general optical state of the lake. (See also W76-11424) (Sims - ISWS)

A brief summary of investigations bearing on the biological productivity of zooplankton in reservoirs located in various geographical zones is presented. A general decrease in species diversity and quantity from the S towards the N was observed. Data regarding the production of separate

LIBRARY U. OF I. URBANA-CHAMPAIGN

trophic levels of the herbivorous zooplankton and predators of the 1st order are given. Production depends on the biomass of the animals forming a given trophic level and the duration of the growing season. The ratio of the production of herbivorous zooplankton to the primary production of the phytoplankton varies from 2.2-20.7%. The humus-containing reservoirs this value is considerably higher--30%. The production of the predatory zooplankton is an average 19.1% of that of the herbivorous zooplankton.--Copyright 1976, Biological Abstracts, Inc.

FOOD AND GROWTH PARAMETERS OF JUVENILE CHINOOK SALMON, ONCORHYNCHUS TSHAWYTSCHA, IN CENTRAL COLUMBIA RIVER,
Battelle-Pacific Northwest Labs., Richland, Wash. Ecosystems Dept.
C. D. Becker.
U S Nat Mar Fish Serv Fish Bull. 71(2), p 387-400, 1973.

Descriptors: *Chinook salmon, *Columbia River, Washington, *Diptera, *Fish diets, *Fish growth, Aquatic insects, Juveniles.
Identifiers: Collembola, Notonectidae, Oncorhynchus-Tshawytscha, Trichoptera.

Juvenile chinook salmon, 0. tshawytscha, in the Hanford area of the free-flowing central Columbia River, Washington consume almost entirely adult and larval stages of aquatic insects. Their diet is dominated by midges (Diptera:Chironomidae). By numbers, adult midges provided 64 and 58% of the diet and larval midges 17 and 18% of the diet, in 1968 and 1969, respectively. The families Hydropsychidae (Trichoptera or caddisflies), Notonectidae (Hemiptera or true bugs), and Hypogastruridae (Collembola or springtails) are of minor numerical importance with a combined utilization of 7% in 1968 and 15% in 1969. Distinctive features of food and feeding activity of juvenile chinook salmon at Hanford are 4-fold: the fish utilize relatively few insect groups, predominantly Chironomidae; they depend largely upon autochthonous river organisms, they select prey drifting, floating, or swimming in the water; and they are apparently habitat opportunists to a large extent. Analysis were made of variation in diet and mumbers of insects consumed between 6 sampling stations distributed along a 38-km section of the river. Data are provided on feeding intensity, fish lengths, length-weight relationships, and coefficients of condition. Seasonal changes in river temperature and discharge, as well as variations in regulated flow levels, are environmental features influencing feeding, growth, and emigration of fish in the Hanford environs.--Copyright 1973, Biological Abstracts, Inc.

DROUGHT RESISTANCE CHARACTERISTICS OF BLUE GRAMA SEEDLINGS,
Agricultural Research Service, Fort Collins, Colo.
A. M. Wilson, D. N. Hyder, and D. D. Briske.
Agronomy Journal, Vol. 68, No. 3, p 479-484, May-June 1976. 5 fig, 3 tab, 11 ref.

Descriptors: *Drought resistance, *Planting management, *Grama grasses, *Root development, *Plant growth, Plant morphology, Xylem, Stomata, Evaporation, Transpiration, Moisture uptake, Greenhouses, Leaves, Environmental control.
Identifiers: *Blue grama seedling, Bouteloua gracilis.

Blue grama (Bouteloua gracilis) seedling drought resistance was studied in relation to stages of shoot and root development. Seedlings restricted to the seminal root or one or two adventitious roots were grown in moist soil of a controlled environment chamber, in a greenhouse and in the field; shoot environment drought was measured by the evaporation rate from a standard pan. Growth drought resistance, which was defined as shoot environment drought sufficient to stop seedling leaf area expansion, was directly related to the critical evaporation/transpiration ratio for seedling growth and to the maximum root water uptake rate. Drought resistance was also inversely proportional to seedling leaf area. In an environment with a constant evaporation rate, leaf area increased to the water supply limit when evaporation from a free water surface was six times greater than transpiration. The amount of vascular tissue in the blue grama root does not increase as the seedling grows. Thus, when a dry surface soil prevents adventitious root formation the size and number of xylem vessels in the seminal root and subcoleoptile internode impose a limit on the volume of water that can be transported to the shoot. Proc Fla State Hortic Soc. 85, p 363-364, 1972

Descriptors: *Root systems, *Saturated soils, *Fungi, *Fungicides
Identifiers: Benomyl, *Carissa-Grandiflora, Dieback, Etiology, Phytophthora-Sp, Rhizoctonia-Solani, Terrazole, *Root rot

Defoliation and dieback of stems of potgrown Carissa grandiflora cv. Boxwood Beauty and 'Bonsai' were found associated with waterlogged soil and severe root rot. Rhizoctonia solani and Phytophthora sp. were consistently isolated from rotting Carissa roots. Both fungi were root rotters but benomyl, which controlled Rhizoctonia root rot, was ineffective against Phytophthora. Phytophthora was adequately controlled by terrazole, which in turn, was ineffective against Rhizoctonia. The existence of such disease complex may help explain the inability of either of these compounds to provide control of Carissa dieback in field tests.--Copyright 1974, Biological Abstracts, Inc.

FOOD HABITS OF YEARLING AND ADU STRIPED BASS, MORONE SAXATIL (WALBAUM), FROM ALBEMARLE SOUN NORTH CAROLINA,
National Marine Fisheries Service, Beaufort, C. Atlantic Estuarine Fisheries Center.
C. S. Manooch, III
Chesapeake Sci. 14(2), p 73-86, 1973.

Descriptors: *Bass, *Fish diets, *North Caroli *Sounds, Amphipoda, Shrimp, Herring, Cra *Fish food organisms.
Identifiers: Alosa-aestivalis, Anchoa-mitchi Brevoortia-tyrannus, Callinectes-sapidus, Ga marid, Morone-saxatils, Penaeid, *Alberma Sound(NC), Striped bass.

A total of 1094 yearling and adult striped bass, saxatilis, were collected from Albemarle Sou North Carolina from July 1970 through Aug 1971. Specimens were captured by gill nets, h and line, trawl, pound nets, and purse seine, ranged in size from 125-714 mm total length. proximately 77% of the fish contained food c sisting of 3249 individual organism. Of 25 spec groups of food organisms identified, 15 were s cies of fish and 10 were taxa of invertebrates. were the main foods of striped bass and occur in 93% of the stomachs containing food. Predo nant species identified were Atlantic menhad Brevoortia tyrannus, blueback herring, A aestivalis, and bay anchovy, Anchoa mitchilli. vertebrates were of secondary importance consisted mainly of blue crabs, Callinec sapidus, penaeid shrimp, and gammarid phipods. Food habits varied substantially with of fish, area, and season of collection. Canni ism was rarely encountered. Only 2 year striped bass from over 200 examined (1%) tained young M. saxatilis. No striped bass found in larger specimens. Striped bass are c ble of consuming clupeids which are approxim ly 60% of striped bass length. Small bass gener fed on smaller fish which averaged 20% of predator's length. Size availability of forage important factor in Albemarle Sound. Striped preferred the soft-rayed species which gener occurred as juveniles in the sound.--Copy 1973, Biological Abstracts, Inc.

THE STRATIGRAPHY OF NORTHERN LAKE SUPERIOR LATE-GLACIAL AND POSTGLACIAL SEDIMENTS.
Canada Centre for Inland Waters, Burlington (Ontario),
C. I. Dell.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 179-192, 1974. 10 fig, 16 ref.

Descriptors: *Lake sediments, *Stratigraphy, *Sedimentation, *Lake Superior, Lakes, Sediments, Glacial sediments, Pleistocene epoch, Geologic history, Geology, Clays, Till, Cores, Onsite investigations, Unconsolidated sediments, Sedimentology.
Identifiers: *Post-glacial sediments, *Northern Lake Superior.

This study described the stratigraphy of unconsolidated sediments in Lake Superior north of latitude 48 deg. The study area consisted of three major offshore topographic basins in addition to several shallow shoal and shelf areas. The basins contain lacustrine sediments with a maximum thickness of about 20 m. Postglacial fine-grained sediments consisting primarily of noncalcareous dark gray silty clays range in thickness up to a maximum of 9 m. They overlie glaciolacustrine sediments with a maximum thickness of about 15 m. The dominant glaciolacustrine sediments are gray calcareous varved clays commonly separated from the underlying till by a thin sequence of silty clays or sands. Reddish brown sandy calcareous till underlies much of northern Lake Superior with a gray clayey calcareous till present only in northeastern part. The tills and glaciolacustrine sediments are exposed on the lake floor most commonly in shallower water on the fringes of the topographic basins and on shoals within the basins. In these areas they may be undergoing erosion with transport and redeposition of the sediment in deeper water. The postglacial fine-grained sediments are generally found only in the basins where their accumulation appears to be related not only to water depth but also to local topography. In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 207-211, 1974. 4 fig, 14 ref.

Descriptors: *Sediments, *Clays, *Sewage, Biological properties, Laboratory tests, Lakes, Biodegradation, Microbial degradation, Anaerobic digestion, Cations, Microorganisms, Biological communities, Soils, Sedimentation, Limnology, Lake sediments.

A laboratory study was initiated to investigate the potential for biologically induced transformations of clay-sized sediments under simulated slack and flowing water conditions of the natural freshwater environment. Soil clay materials (less than 2 micrometers) representing surface, subsurface and geologic materials were equilibrated with distilled water and sewage effluents in both static and dynamic environments for periods up to two months. The following analyses were conducted weekly: enumeration of microorganisms, reaction (pH), potassium, silicon, aluminum, electrical conductivity and clay mineralogy. The results of this study indicated that in dynamic systems of clay-sewage and clay-water suspensions, the transformation of the clay material was minimal and within errors of determination. The static systems of clay-sewage, particularly with clay materials from the geologic substratum showed consistent time trends in the parameters measured. The following time trends were observed: an increasing microbial population; slightly increased pH; decreased mica, expandables, and vermiculite; increased quartz and chlorite; increased silica in solution; and decreased potassium in solution. These combined data suggested that the clay-sized sediment had been altered. It was concluded that the environment found most conductive to sediment alteration was one with a high microbial population, a carbonate substrate, and static water (anaerobic) conditions. HEAVY MINERALS IN THE SANDS OF SOUTHERN AND EASTERN LAKE ONTARIO,
Rochester Univ. N. Y. Dept. of Geological Sciences.
B. W. Selleck.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 697-703, 1974. 5 fig, 1 tab, 16 ref.

Descriptors: *Sands, *Mineralogy, *Lake Ontario, Sediments, Sedimentology, Beaches, Lakes, Shores, Sampling, Surveys, Rocks, Erosion, Sedimentation.
Identifiers: *Sand sources, Magnetic heavy minerals, Monoclinic pyroxene, Hypersthene, Garnets.

The magnetic heavy mineral fraction of samples of sand-size sediment from the beaches and offshore sand bodies of southern and eastern Lake Ontario has been analyzed to determine variability in the mineral assemblage resulting from longshore transport and associated sedimentary processes. In the samples examined, the ratio of monoclinic pyroxene to hypersthene progressively decreased from west to east along the southern shore. This variation is produced by the dilution of a monoclinic pyroxene-rich suite by a hypersthene-rich suite during easterly transport of sand. The monoclinic pyroxene-rich suite is derived, at least in part, form the large subaqueous sand body offshore of the Niagara River mouth in Lake Ontario. The hypersthene-rich suite is derived from the erosion of shoreline and subaqueous tills along the western New York shore. Other significant variations noted were: (1) relative enrichment of hornblende in lake sands, compared with beach sands; (2) magnetically susceptible rock fragments are most abundant in the separate of samples from the Mexico Bay-Stony Point sands; and (3) the ratio of purple-colorless to red-orange garnet is higher in lake sands than in beach sands. SCOUR AND FILL PATTERNS IN POOL-RAPID RIVERS,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
E. Silverston.
Master of Science Thesis, 1975. 85 p, 36 fig, 1 tab, 7 ref, 1 append.

Descriptors: *Scour, *River flow, *River systems, *Deposition(Sediments), *River forecasting, River beds, Open channel flow, Colorado River, Model studies, Flow rates, Equilibrium, Hydrograph analysis.
Identifiers: *Pool-rapid rivers.

Analyzes are presented of scour and fill patterns of a pool-rapid river and how these vary with sediment supply, river width, slope and depth, sediment sizes, downstream rapids, changes in flow rate and bed roughness. The analysis predicts patterns for an imaginary model of a portion of a river with characteristics like those of the Colorado. Results verified that a change in flow indicates pool bed fluctuation by scouring or filling and that the time period until equilibrium varies by several orders of magnitude. With an increase in flow the equilibrium depth increases faster than the head on the control; therefore, pools scour if the flood continues long enough. Fill can be expected along the bed as the flow decreases. A downstream pool following several other pools will scour and fill many times before scouring to equilibrium, since a pool cannot reach equilibrium until all those upstream have. Scour holes and fill mounds remain in the system if the hydrograph time period is less than the time necessary for equilibrium to occur. The pool-rapid river is compared with less complex systems to define its special characteristics. (Jahns-Arizona)

SEDIMENT YIELD AS RELATED TO A STOCHASTIC MODEL OF EPHERMERAL RUNOFF,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
K. G. Renard, and L. J. Lane.
In: Present and Prospective Technology for Predicting Sediment Yield and Sources, Proceedings of the Sediment Yield Workshop, November 28-

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

30, 1972, U.S. Department of Agriculture Laboratory, Oxford, Mississippi, p 253-263. 10 fig, 3 tab, 24 ref.

Descriptors: *Sediment yield, *Mathematical models, *Ephemeral streams, *Runoff forecasting, Rainfall-runoff relationships, Sediment transport, Stochastic processes, Synthetic hydrology, Watershed management, Arizona.
Identifiers: *Stochastic runoff model, Walnut Gulch Experimental Watershed(Ariz).

A description is presented of a sediment-yield model for ephermal streams, incorporating a stochastic model of runoff with a deterministic sediment-transport relation. The model was developed and verified with field data from the Walnut Gulch Experimental Watershed in southeastern Arizona. The stochastic and sediment-transport models are described. Comparisons between observed and synthetic runoff data indicate that the model produces data comparable to observed facts except for season length variability; however, the mean season length values correspond. Log-normal distributions were fitted to the synthetic annual runoff and sediment data produced with this model. A plot of annual runoff volumes for 50-year sequences of synthetic data on each of two watersheds is graphed and analyzed, with a similar plotting of synthetic annual sediment-yield data. Sediment and runoff volumes for any probability were greater for the larger watershed although the mean annual runoff was less. Possible applications and limitations of the model are discussed and recommendations for future work outlined. (Jahns-Arizona)

HUTTON'S SHEARWATERS INITIATING LOCAL SOIL EROSION IN THE SEAWARD KAIKOURA RANGE,
Forest and Range Experiment Station, Rangiora (New Zealand).
G. R. Evans.
N Z J Sci. 16(3), p 637-642, 1973.

Descriptors: Grasses, Erosion, *Soil erosion, *Vegetation effects, *Turf grasses, Deer, Goats.
Identifiers: Chamois, Chionochloa, *New Zealand, Puffinus-Buttoni, *Shearwaters, Snowgrass swards, Sea birds.

When Hutton's shearwaters (Puffinus buttoni) first occupy a new nesting site the initial destruction of the snowgrass sward (Chionochloa spp.) is rapid. With the continued destruction of these sites by the shearwaters, aided by goats, deer and chamois, the snowgrass swards are killed; this allows severe erosion to proceed at high altitudes in the Seaward Kaikoura Range (New Zealand).--Copyright 1974, Biological Abstracts, Inc.

WETTABILITY OF HUMIC ACID AND ITS SALTS,
M. Tschapek, and G. P. Ardizzi.
Z Pflanzenernaehr Bodenkd. 135(1), p 16-31, 1973.

Descriptors: *Wettability, *Humic acid, Salts, Organic compounds, Ions, Pollutant identification.
Identifiers: *Humates, Humic-Acid.

Homoionic humates are readily wetted by hydrocarbons (apolar liquid) and water (polar liquid). By wetting with hydrocarbons low heats of immersion (or wetting) are registered, whereas by wetting with water high heats of immersion are registered and colloidal solutions are formed. Humic acid is wetted by hydrocarbons, producing low heats. It floats on the water surface, and produces the heat of immersion. The surfaces of humic acid and humate are covered by hydrophilic and hydrophobic sites. Humic acid and humate contain about 2 hydrophobic sites/100A2.--Copyright 1974, Biological Abstracts, Inc.

Biofizika 20(1), p 38-40, 1975.

Descriptors: *Sorption, *Polymers, Moisture content, *Nuclear magnetic resonance, Cellulose, Analytical techniques, Adsorption, Conductivity.
Identifiers: *Biopolymers, *Dielectric studies, Starch, Gelatin.

NMR spin echo and dielectric studies of water in biopolymers were carried out. The data on the relationship between the time of spin-spin relaxation, the energy of movement activation and electroconductivity, and moisture-content indicate that water sorption on biopolymers e.g. gelatin, starch, cellulose, up to a certain humidity value, takes place in a vacuum. With an increase of moisture-content the proces of sorption may be presented as a solution of low-molecular substance in a high-molecular one.--Copyright 1975, Biological Abstracts, Inc.

Ural Science Center, Sverdlovsk (USSR). Inst. of Plant and Animal Ecology.
N. V. Kulikov, and I. V. Molchanova.
Ekologiya 5(2), p 69-70, 1974.

Descriptors: *Strontium radioisotopes, *Tundra, Vegetation, Soil analysis, Soil water, Plant physiology, Surface waters, Bogs.
Identifiers: *Strontium-90, *USSR, *Biogecoenoses.

Data are presented on the change of Sr90 content in the soil and plants of the subarctic tundra between 1966 and 1970. During this period the total content of the radionuclide in tundra plants dropped from 53-17% in the soil-vegetation cover and from 14-5% in the bog. This decrease of Sr90 concentration in plants should have resulted in an increase of its content in the upper soil layers. Sr90 concentration in the soil did not increase but rather decreased. This was attributed to the removal of the radionuclide from biogeocoenoses by surface and soil waters.--Copyright 1976, Biological Abstracts, Inc.

Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 582, $8.00 in paper copy, $3.00 in microfiche. Report UHM-20, Hydraulic Engineering Laboratory, University of California, Berkeley, California, May 1976. 218 p, 67 fig, 10 tab, 36 ref, 3 append. (California Water Resources Center Project UCAL-WRC-W-486).

Descriptors: *Mixing, *Saline water-freshwater interfaces, Estuaries, Tidal waters, Flow, *Open channel flow, Path of pollutants, *Dispersion, *Stratified flow, *Density stratification, Circulation.
Identifiers: *Transverse dispersion.

This study investigates the transverse mixing characteristics of a tidal open channel flow both for neutrally buoyant flow and a partially stratified flow. The effect of the geometry of the cross-section on lateral mixing is investigated by experiments made in uniform and nonuniform cross-sections. The first part deals with the influence of vertical density stratification on the rate of transverse dispersion without the presence of any transverse circulation. In the second part, the effect of nonuniformity of the cross-sectional area on transverse mixing is investigated; an effect of the nonuniformity is the creation of transverse density gradients and transverse circulation patterns. ANNUAL REPORT - VTE/MSF MODULE - FOUNTAIN VALLEY TEST FACILITY, JULY 1, 1975 - APRIL 30, 1976.
Burns and Roe Industrial Services Corp., Paramus, N. J.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 572, $7.50 in paper copy, $3.00 in microfiche. Office of Water Research and Technology, Report OWRT/S--76/51, April 1976. 181 p, 50 fig, 42 tab. DOI-14-30-3164 14-34-0001-6518.

Descriptors: *Desalination plants, *Desalination processes, *Distillation, *Heat transfer, Sea water, Operating and maintenance, Corrosion, California, Fouling.
Identifiers: *VTE/MSF Module, *Fountain Valley(Calif), Calcium sulfate, Cuprous oxide.

This is the final report on operation and developmental activities on the VTE/MSF sea water desalting test module at Fountain Valley, California. Because of severe noise, emitted primarily from the boiler area, module operations were restricted to daylight hours, five (5) days a week. Technical data were collected in four (4) modes of operation. Extensive heat transfer data were collected over a temperature range of 110F to 220F and new design equations were developed for the combined VTE/MSF process. Heat transfer coefficients for all four (4) VTE bundles are given. Heat exchanger tube corrosion rates are given for all operating modes. Calcium sulfate and cuprous oxide caused fouling in the VTE bundles. (OWRT)

PROCESS FOR THE REGENERATION OF ION-EXCHANGE RESINS AND APPLICATIONS THEREOF,
Institutul de Proiectari Pentru Industria Chimica Anorganica si Ingrasamintelor, Bucharest (Rumania). (Assignee).
N. M. Arion.
U S Patent No 3,956,115, 7 p, 4 fig, 5 ref. Official Gazette of the United States Patent Office, Vol 946, No 2, p 727, May 11, 1976.

Descriptors: *Patents, *Water purification, *Water treatment, *Desalination, *Demineralization, *Ion exchange, Resins, Anion exchange, Cation exchange.
Identifiers: *Resin regeneration.

The invention relates to a process for the regeneration of cationic and anionic ion exchange resins with concentrated acids or bases, thereby obtaining a concentrated effluent from which the eluate salt and the possible excess of regenerant are advantageously recovered. The concentrations of the acids and bases used in regeneration are much higher than those known as used heretofore. The process is carried out under conditions such that the resin temperature at the regenerant liquid/resin bead interface does not exceed a maximum of about 20C. An important decrease of the heat amount released in regeneration is reached by the removal, prior to introducing the concentrated regenerant, of the water from the ion exchange resin interstices. The elimination of the liquid from the interstices of the ion exchange resin, water or concentrated regenerant, may be performed by blowing-in of compressed air or inert gas, by vacuum suction, by centrifuging, or by combining these two means. The purification and valorization of waste waters and diluted solutions by fixing their components on ion exchangers, that may be regenerated according to the invention, leads not only to their purification. The water resulting as effluent is an advancedly demineralized water of high purity. (Sinha-OEIS)

THE AVAILABILITY OF DESALTING FOR WATER SUPPLY FROM SALINE SOURCES,
Office of Water Research an Technology, Washington, D. C.
W. L. Barnes, Jr.
In Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas, April 2-4, 1975, Wilmington, North Carolina, University of North Carolina, p 102 110.

Descriptors: *Desalination, *Distillation, *Crystallization, *Reverse osmosis, *Electrodialysis, *Ion exchange, Separation techniques, Desalnation processes, Membranes, Brackish water, Saline water, Freezing, Treatment facilities, Coasts, Florida.
Identifiers: Eutectic freezing.

A review of the state of the art of various desalination processes is presented. These processes fall into two categories: those involving a phase change such as distillation or crystallization and those which remove salts from water in the liquid phase by such mechanisms as reverse osmosis, electrodialysis, or ion exchange. Distillation processes account for about 93% of all desalination activities throughout the world. Membrane processes, along with ion exchange, are historically the preferred methods for desalting brackish waters, though seawater membrane desalting systems operate at a relatively low product water recovery amounting to about 30%. Eutectic freezing offers a process universally acceptable for all types of saline waste streams and does not require pre-treatment. An additional advantage of the process is its high product recovery which amounts to over 99% of the initial saline water treated. The practicality of desalination is being demonstrated in the southeastern coastal states, particularly Florida, where desalting plants are used to treat brackish water. Descriptors: *Salts, *Water quality, Water pollution, Agriculture, *Salt tolerance, Plant tissues, Plant physiology, Cytological studies, Plant morphology, Tobacco.
Identifiers: Salt tolerant mutants, Plant mutations.

Much successful work has been done on altering the environment by irrigation to increase the amount of land in agricultural production, however the costs may increase as suitable water becomes more difficult to develop. The alternative may be to adjust the plants to accept lower quality water through selection for appropriate spontaneous mutants. Methods for the selection of desirable spontaneous mutants require the application of environmental pressure to give the mutant a competitive advantage and also require the examination of millions of individual plants. To accomplish this in field trials is time consuming and costly. Instead this project employs individual cells in tissue culture where ten million cells occupy 100 ml and each cell effectively is a plant, because a plant can be regenerated from an individual cell. Plant properties such as salt tolerance which is exhibited on the cellular level can be selected in tissue culture at much less cost due to the small scale required. The focus of this project has been toward the selection of salt tolerant mutants. Two lines of tobacco cells, tolerant to NaCl levels of 8000 ppm, have been selected; normal tolerance to NaCl in this species is 800 ppm. Plants have been regenerated from the tissue cultures at many levels of NaCl tolerance between these extremes, and these plants are currently being tested for NaCl tolerance and for mutation inheritability. Although practical tolerance needs may not exceed 2000-3000 ppm, the higher ranges of salt tolerance may yield mutants with better yields at the moderate tolerance levels. Considerable progress has been made toward tissue culture mutant selection systems for oats, wheat, soybean, corn, and sugar beets. Selection for salt tolerant mutants is currently underway for both oats and wheat.

An Urban Information Systems Inter-Agency Committee (USAC) Project in Wichita Falls, Texas, applies computer use to the full range of municipal functions. It is divided into several systems, including the Water Utility Processing System (WUPS), designed to support Wichita Falls in selling its water resources with associated services. The system is designed to provide for determining the cost of refuse, water, sewer, and assessment services, billing each customer, and collecting payment on the accounts. The hardware for the system includes an International Business Machines (IBM) 370/145 computer, storage devices, five tape drives, a reader/punch, 19 video terminal devices, and a cartridge reader. The software consists of IBM's Disk Operating System/Virtual Storage (DOS/VS), IBM's Customer Information Control System (CICS) for telecommunications, and a spooling system. THE EFFLUENT-FREE BLEACHED KRAFT PULP MILL. PART VI. SUBSTANTIAL SUBSTITUTION OF CHLORINE DIOXIDE FOR CHLORINE IN THE FIRST STAGE OF BLEACHING,
Toronto Univ. (Ontario). Dept. of Chemical Engineering.
W. H. Rapson, C. B. Anderson, and D. W. Reeve.
In: TAPPI Alkaline Pulping Conference, Williamsburg, Virginia, October 27-29, 1975, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 177-188. 3 fig, 5 ref, 6 tab.

Descriptors: *Water pollution control, *Bleaching wastes, Pulp and paper industry, Water pollution sources, Chlorine, Toxicity, Biochemical oxygen demand, Chemical oxygen demand, Chlorides, Color, Acidity, Corrosion, Closed conduit flow, Pollution abatement, Canada, Foreign countries, Sodium chloride.
Identifiers: Kraft mills, *Chlorine dioxide, Sodium hydroxide, Closed systems.

Studies showed that substantial substitution of chlorine dioxide for chlorine in the first stage of kraft pulp bleaching improves pulp yield, strength, color stability, and cleanliness. Bleach plant effluent properties are also greatly improved; with 70% replacement, color is decreased by about one-half, toxicity is nearly eliminated, BOD and COD are decreased 15-20% and chloride content is decreased to one-half that found with 100% chlorine in the first stage. The NaOH required for extraction is decreased substantially, and in an effluent free mill it is decreased to one-half compared with all chlorine. As chlorine dioxide is substituted for chlorine, acidity and chloride concentration are decreased, thereby decreasing corrosivity. When pollution is eliminated by introducing bleach plant effluent into the recovery system, 70% replacement of chlorine by chlorine dioxide decreases to one-half the quantity of NaCl introduced into the pulping chemical recovery cycle. The new closed-cycle bleached kraft pulp mill now under construction at Great Lakes Paper Co., Thunder Bay, Ontario, is designed to use a mixture of 70% chlorine dioxide and 30% chlorine to supply the necessary available chlorine in the first bleaching stage. WATER REUSE AND RECYCLE IN THE C(D)EHDED BLEACH SEQUENCE,
CIP Research Ltd., Hawkesbury (Ontario).
J. A. Histed, and F. M. A. Nicolle.
In: TAPPI Alkaline Pulping Conference, Williamsburg, Virginia, October 27-29, 1975, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 167-176. 3 fig, 5 ref, 6 tab.

Descriptors: *Bleaching wastes, *Water reuse, *Pulp and paper industry, Water pollution sources, Wastes, Industrial wastes, Water pollution control, *Recycling, Waste treatment, Wastewater treatment, Industrial water, Effluents, Water conservation.
Identifiers: Wash water, Washing(Pulp), Countercurrent washing.

The low temperature normally associated with the hypochlorite stage of the C(D)EHDED bleach sequence has presented a serious obstacle to direct countercurrent pulp washing. This study demonstrates that the hypochlorite stage can be operated at 80C (176 F) in a tight countercurrent washing system with no adverse effect on the properties of the fully bleached pulp. Extensive recycling of the chlorination filtrate reduced the volume of effluent from the chlorination washer to 491 gallons/air-dry ton. The total effluent from the EHDED stages was reduced to 976 gallons/air-dry ton by means of a tight countercurrent washing system. This represents a 10-fold reduction in effluent volume when compared with the present-day practice of most mills using this bleaching sequence. (Witt-IPC)

vailable from the National Technical Informaon Service, Springfield, Va., 22161, as PB-256 8, $4.00 in paper copy, $3.00 in microfiche. resented at Energy and Agriculture Conference, . Louis, Missouri, June 16-19, 1976. (1976). 26 p, fig, 4 tab, 22 ref. OWRT A-0380NEB(1), 14-34-01-6028.

escriptors: Irrigation, Management, Energy, onservation, *Irrigation systems, *Water utilizaon, Pumping, *Pumping plants, *Irrigation praces, *Water conservation, Soil moisture, Irrigaon efficiency, Costs.
entifiers: *Energy conservation.

ecause irrigation is such a large consumer of the tal energy used in production agriculture, reducn of the energy used to pump water can have a nificant impact on agriculture's energy requirents. This energy requirement can be lessened reducing the amount of water pumped, improvg the irrigation efficiency, improving the pumpg plant performance and lowering the pressure quirements. Water and energy conservation are cussed relative to current irrigation practices d existing technology. Several possible areas are scribed where potential energy savings exist. e design of new equipment and improved nagement of irrigation systems will provide hniques to conserve both water and energy. ese energy saving techniques can be used to ine a continued high level of production in the e of energy shortages, cost increases and ited water. Pump irrigators in the future may ve to accept soil moisture deficits and the result reduced yields in some years because of short rgy supplies and scheduled electrical power inruptions.

Identifiers: Quadratic programming, Economics models.

California agriculture is continually adjusting to changing demand and supply conditions, but the events associated with the 'energy crisis' of 1973-74 appeared as an abrupt shift in production conditions rather than a random shock or a gradual trend in events of the past. An additional shock was adverse weather conditions in several important grain producing areas of the world resulting in increasing concern over food supplies both here and abroad, and the associated inflation due to rising food and energy prices. This thesis explores the effects of increases in energy costs (gasoline and diesel fuels) and energy-based inputs (nitrogen fertilizer) on the cropping pattern in California for an important set of commodities including major vegetable and field crops under alternative assumptions as to demand for the commodities. EFFECTS OF WATER STRESS UNDER CONTRASTING ENVIRONMENTAL CONDITIONS ON TRANSPIRATION AND PHOTOSYNTHESIS IN SOYBEAN,
Department of Scientific and Industrial Research, Palmerston North (New Zealand) Plant Physiology Div.
M. F. Beardsell, K. J. Mitchell, and R. G. Thomas.
J Exp Bot. 24(80), p 579-586, 1973.

Descriptors: *Transpiration, *Photosynthesis, *Soybeans, Temperature, Stomata, Soil water, Root systems.
Identifiers: Glycine-Max, Mesophyll.

Continuous and simultaneous measurements of CO2 exchange and transpiration rates of whole soybean plants were made under contrasting, controlled environmental conditions when water stress was imposed by withholding H2O. Daytime temperatures and vapor pressure deficits were 27.5C/12 mbar; 27.5C/5 mbar; 22.5C/12 mbar, and 22.5C/5 mbar. The experimental conditions were virtually the same as the conditions under which the plants had been grown. Under all 4 treatments photosynthesis and transpiration rates were closely correlated as water stress increased, but in view of the evidence for a significant mesophyll resistance to photosynthesis in both stressed and unstressed plants it is not considered that this is due to total stomatal control. At -0.4 bar soil water potential (4 soil) the rates of transpiration and photosynthesis became independent of the atmosphere conditions and were very similar under all treatments. This was attributed to slow movement of H2O into the root zone from the surrounding soil with associated stomatal closure limiting the rates of water uptake and transpiration. With decreasing 4 soil, relative water content of the leaf (RWC) fell more rapidly and to lower levels under 27.5C/12 mbar conditions than under the other treatments. The least reduction in RWC was under the greatest relative effect on rates of gaseous exchange under 27.5C/12 mbar conditions and least under 22.5C/5 mbar conditions.--Copyright 1974, Biological Abstracts, Inc.

TRANSPIRATION AND PHOTOSYNTHESIS IN SOYBEAN: EFFECTS OF TEMPERATURE AND VAPOUR PRESSURE DEFICIT,
Department of Scientific and Industrial Research, Palmerston North (New Zealand) Plant Physiology Div.
M. F. Beardsell, K. J. Mitchell, and R. G. Thomas.
J Exp Bot. 24(80), p 587-595, 1973.

Descriptors: *Transpiration, *Photosynthesis, *Soybeans, Temperature, Vapor pressure.
Identifiers: Glycine-max, Mesophyll resistance.

Continuous and simultaneous measurements of CO2 exchange and transpiration rates of whole soybean plants were made under contrasting, controlled evironmental conditions for periods of up to 3 days. Daytime temperatures and vapor pressure deficits (VPD) were 27.5C/12 mb; 27.5C/mb; 22.5C/12 mb, 22.5C/ mb. Night temperatures were 5c lower than day temperatures and night VPD was 2.7 mb and 3.5 mb at the higher and lower temperature respectively. The experimental conditions were virtually the same as those under which the plants had been grown. Transpiration rates were higher at the higher VPD but were also influenced by temperature. At 12 mb VPD the rates were 16 per cent lower at 22.5C than at 27.5C. Temperature had no effect on the transpiration rate at 5 mb VPD. Photosynthesis rates were lower at 5 mb VPD than at 12 mb VPD at both temperatures: the difference was substantially greater (c. 70%) at 22.5C. Under all treatments mesophyll resistance (r'm) appeared to have a major effect on the photosynthetic rate, and varied more than twofold between treatments. r'm was highest in plants grown at 22.5C/5 mb VPD and lowest at 27.5C/12 mb VPD.--Copyright 1974, Biological Abstracts, Inc.

ROTATABLE SPRINKLER AND WATER DEFLECTOR USED THEREWITH,
Johns-Manville Corp., Denver, Colo. (Assignee).
P. N. Cassimatis, and J. R. McComas.
U. S. Patent No. 3,955,762, 7 p, 10 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 946, No 2, p 616, May 11, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficiency, Water distribution(Applied), Application equipment, Nozzles, Deflection.

A rotatable impact sprinkler is described which includes a nozzle through which a jet of water issues. An oscillating arm has an end movable in front of and to one side of the nozzle. The sprinkler also includes a water deflector which is connected with this end of the oscillating arm and which is movable into and out of the water jet. The deflector includes three water deflecting surfaces which receive and redirect water from the jet in a smooth, substantially turbulent free manner. This water is first redirected along a first straight path at least approximately 90 degrees from the axis of the jet. It is then redirected along a second path at an acute angle with and in front of the first path and thereafter it is redirected along a third path which is approximately parallel with the axis of the issuing jet. (Sinha - OEIS)

SPRINKLER ADJUSTMENT,
Telsco Industries, Garland, Tex. (Assignee).
C. W. Phaup.
U. S. Patent No. 3,955, 764, 4 p, 5 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 946, No 2, p 617, May 11, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficiency, Water distribution(Applied), Application equipment, Nozzles.
Identifiers: Pop-up sprinklers.

LIBRARY U. OF I. URBANA-CHAMPAIGN

An adjustable nozzle for rotary pop-up sprinklers allows an operator to accurately position the arc of coverage to any desired location while the pop-up sprinkler is in operation without rotating the entire sprinkler relative to the riser on which it is threaded. The invention eliminates the need for special adjusting tools, and hides the fact that the nozzle can be adjusted from the intermeddler who tampers with easily accessible controls. (Sinha-OEIS)

EFFECTS OF IRRIGATION: MULCH AND N-FERTILIZERS ON YIELD COMPONENTS OF ARABICA COFFEE IN KENYA,
Edinburgh Univ. (Scotland). Inst. of Tree Biology.
M. G. R. Cannell.
Exp Agric. 9(3); p 225-232, 1973

Descriptors: *Irrigation effects, Africa, *Mulching, Fertilizers, *Crop production, *Nitrogen, Fruit crops.
Identifiers: *Kenya, Mulch, *Coffee(Arabica).

Irrigation, mulch and N-fertilizers increased the yield of fresh fruit/tree by 66% due to increases of 42% in the number of fruiting nodes/tree, 14% in number of fruits/node and 15% in fresh weight/fruit; these 3 yield components accounted for 42, 13 and 6% of the variation in yield among all treatments combinations, Bean/fruit weight ratios and times of flowering were not affected. Correlations between yield components were positive, suggesting that still more nodes could be produced per tree and per unit area before physiological limits to yield were reached.--Copyright 1973, Biological Abstracts, Inc.

CORN PLANT WATER STRESS AS INFLUENCED BY CHISELING, IRRIGATION, AND WATER TABLE DEPTH,
Agricultural Research Service, Florence, S.C. Coastal Plains Soil and Water Conservation Research Center.
D. C. Reicosky, R. B. Campbell, and C. W. Doty.
Agronomy Journal, Vol. 68, No. 3, p 499-503, May-June 1976. 5 fig, 3 tab, 7 ref.

Descriptors: *Corn(Field), *Water table, *Soil-water-plant relationships, *Crop production, Soil management, Crop response, *Irrigation effects, Stomata, Cultivation, Moisture stress, *Chiselling.

Chiseling and irrigation effects on plant water status were evaluated through leaf water potential, stem diameter and stomatal resistance measurements. Corn (Zeas mays L.) grown on a Varina sandy loam chiseled to 38 cm was compared with that grown on conventionally tilled plots. Chiseling had no effect on daily minimum leaf water potential the first year (1972) and only a slight effect on stomatal resistance, but irrigating had some beneficial effect. At tasseling in 1973, with a water table 80 cm from the surface, chiseling produced deeper-rooted corn that allowed water utilization in the capillary fringe above the water table; leaf water potential increased slightly while stomatal resistance and stem diameter fluctuation decreased. Plant-water status on chiseled plots was similar to that on furrow-irrigated plots. Improved midday plant water status caused a 8-metric ton/ha increase in corn ear yields. Results indicate that chiseling of soils with root restricting layers can increase corn production, especially when the water table is about 80 cm from the surface tasseling. (Jahns-Arizona)

SOIL WATER UPTAKE BY ALFALFA,
Agricultural Research Service, Kimberly, Idaho, Snake River Conservation Research Center.
R. A. Kohl, and J. J. Kolar.
Agronomy Journal, Vol. 68, No. 3, p 536-538, May-June 1976. 4 fig, 14 ref.

Descriptors: *Soil water movement, Soil water, *Moisture uptake, *Alfalfa, *Soil water plant relationships, Root zone, Xylem, Soil profiles, Moisture stress.

Soil water uptake by alfalfa (Medicago sativa L.) was studied by monitoring a seed crop with a neutron moisture probe. Plant water potential measurements support passive uptake. Water was withdrawn in the lower root zone, where soil matric potentials were between -7 and -10 bars, while the upper portion of the profile was above -2 bars. Results indicate that passive water uptake requires large water potential differences between the root xylem and soil in the moist upper portion of the profile. Alfalfa plant moisture potentials decreased through the growing season, possibly due to moisture stress and maturity. While water is preferentially taken up from layers where the soil water potential is high, it continues being withdrawn from layers of lower potential. Root location (shallow or deep) does not appear to influence water uptake. (Jahns-Arizona)

NITROGEN-SILICON INTERACTION IN PLANTS GROWN IN DESERT SOIL WITH NITROGEN DEFICIENCY,
California Univ., Los Angeles. Lab. of Nuclear Medicine and Radiation Biology.
A. Wallace, E. M. Romney, and R. T. Mueller.
Agronomy Journal, Vol. 68, No. 3, p 529-30, May-June 1976. 5 tab, 7 ref.

Descriptors: *Nitrogen, *Plant growth, *Fertilizers, *Range grasses, *Barley, Fertility, Arid lands, Beans, Calcareous soils, Soil dynamics, Deficient elements, Cations, Anions, Soil moisture, Sierozems.
Identifiers: *Silicon, Ion competition.

Comparisons were made for the yield and nutrient status of native range grass (Hilaria rigida), barley (Hordeum vulgare L. 'Atlas 57') and bush beans (Phaseolus vulgaris) grown in a glasshouse in soils from shrub and bare desert areas. The latter two plants were grown with and without added N fertilizer. The relationship of N to other anions was studied to determine the nutrient relationships in desert soil infertility even with N supplied. Plants grown in the infertile soil had greatly decreased yields and slightly lower total cation concentrations, were low in N and usually had greater Si concentrations. Nitrogen fertilizer caused only a slight yield improvement in infertile soils but increased N and reduced Si in the plants. Barley yields were much greater on shrub-area soils than bare-area ones, and added N fertilizer did little to overcome the suppressed yield from the latter soil. Similar results were obtained with bush bean. The Si appeared to enter the plant's cation-anion balance. (Jahns-Arizona)

EFFECTS OF IRRIGATION REGIMES, PLANTING DATES, NITROGEN LEVELS, AND ROW SPACING ON SAFFLOWER CULTIVARS,
Agricultural Research Service, Phoenix, Ariz.
G. H. Abel.
Agronomy Journal, Vol. 68, No. 3, p 448-451, May-June 1976. 8 tab, 7 ref.

Descriptors: *Irrigation effects, *Planting management, *Nitrogen, *Fertilization, *Crop response, Irrigation efficiency, Crop production, Arid lands, Arizona, Water management(Applied), Water conservation.
Identifiers: *Safflower.

In three experiments on safflower (Carthamus tinctarius L.) cultivars over a 3 year period seed yields were greater in the last two years with crops planted on December 15 than those planted February 15. Plants in two-row plots produced fewer seeds/head and smaller seeds than those in one-row plots, but increased populations in the former group compensated for such deficiencies and the yields were comparable. An irrigation regime involving early cut off conserved water and labor, reduced weed growth and produced optimum seed yields at lower levels of nitrogen fertilization. The best fertilization levels were from 84 to 336 kg/ha, according to the planting date, irrigation regime and cultivar. For the Laveen clay loam soil at the test site (Mesa, Arizona), 168 kg/ha was optimum for a December planting; quantities exceeding 84 kg/ha had no yield advantage with a February planting. The 'Dart' cultivar outyielded all others used, especially when given the optimum fertilization and irrigation treatment. (Jahns-Arizona)

FERTILIZING DRYLAND GRAIN SORGHUM ON UPLAND SOILS THE 20- TO 26- INCH RAINFALL AREA IN KANSAS,
Kansas State Univ., Hays. Fort Hays Branch Experiment Station
C. A. Thompson.
Kansas Bulletin No. 579, Kansas Agricultural Experiment Station Kansas State Univ., Manhattan, 1975. 20 p. 6 fig, 11 tab.

Descriptors: *Fertilization, *Crop response, *Grain sorghum, *Dry farming, *Kansas, Nitrogen, Soil moisture, Stubble mulching, Phosphorus, Soil-water-plant relationships, Water utilization.

The results are presented of 227 dryland grain sorghum fertility experiments conducted on upland sites in Kansas from 1964 to 1972. The study area was characterized by average yearly rainfall of 20 to 26 inches and had been unirrigated. Nitrogen had the greatest positive effect on grain yields, with 72% of the sites responding. The dryland sorghum did not respond satisfactorily to potassium, sulfur, zinc, iron, manganese or copper; however, extremely eroded soils or newly established terrace channels may respond to zinc. Response to N improved as the soil moisture increased (up to 92% with more than 54 inches of moist soil). Plots fertilized with N produced yields of up to 10 bu/a more than unfertilized plots as soil moisture increased. Yield increases were small when the quantity of moist soil was less than 6 inches. Stored moisture may be improved by stubble mulch farming, minimum tillage, till-plant systems and combinations of chemical tillage. Water-use efficiency is also enhanced by increased soil moisture (2.33 bu/in water at low soil moisture to 3.35 bu/in water at higher levels). Efficient N use and expected yield rates are discussed along with soil phosphorus effects. (Jahns-Arizona)

NITROGEN FLUX INTO CORN ROOTS AS INFLUENCED BY SHOOT REQUIREMENT,
Agricultural Research Service, Byron, Ga.
J. H. Edwards, and S. A. Barber.
Agronomy Journal, Vol. 68, No. 3, p 471-4, May-June 1976. 3 tab, 8 ref.

Descriptors: *Nitrogen, *Fertilization, *Nutrient requirements, *Corn(Field), *Root systems, Plowing management, Plant growth, Absorption.
Identifiers: Root-trimming, Root splitting.

xperiments were conducted to determine the in-
uence of shoot N requirement on N influx/m of
orn roots. Trimmed- and split-root procedures
ere used for solution culture experiments in the
owth chamber to vary the N absorbing roots/unit
shoot and assess the impact on N influx. Roots
immed 2 days before influx measurement had
ight increases in the N influx/m of root, causing
duced N uptake/plant. Roots split between N-
ntaining and N-free solutions from seedling
age until influx measurement at 16 or 18 days had
eater increases in net N influx than trimmed
ots had. Both experiments revealed no relation
tween N level within the root and N uptake
te/m of root. Increased shoot demand for N does
t immediately affect N influx into the root, but
stress causes an increased influx capability.
ants developing throughout their growth cycle
th N restricted to part of the root system may

sture, *Temperature, Correlation analysis,
atology.

Identifiers: Tetranychus-Turkestani.

Computer analysis of population data for mites, predominantly Tetranychus turkestani Ugarov and Nikolski, in 8 soybean fields during a 7-yr period showed a significant correlation with both rainfall and maximum temperature. Rainfall accounted for 51.3% and average maximum temperature for 25.3% of the population variation. Climatological conditions during Aug. appeared most important. Correlation of rainfall totals with mite population for each of the mo. June through Sept. indicated that Aug. rainfall was most influential. Moreover, of the monthly average maximum temperatures only those of Aug. were significantly related to peaks of mite abundance. Measurement of soybean leaf temperatures for 2 wk with electrical monitoring equipment showed that T. turkestani lives under temperature conditions that can fluctuate widely within short periods.--Copyright 1973, Biological Abstracts, Inc.

Available from the National Technical Information Service Springfield, Va as PB-256 207, $4.00 in paper copy, $3.00 in microfiche. Vermont Water Resources Research Center, Burlington, July 1975. 28 p, 5 fig, 3 tab, 9 ref. OWRT A-022-Vt(1).

Descriptors: *Mapping, Remote sensing, *Vegetation, *Wetlands, Lakes, *Vermont, *Aerial photography, Canopy, *Classification, Methodology, Deltas, Rivers.
Identifiers: *Lake Champlain(Vt), Missiquoi River delta(Vt), Lamoille River delta(Vt).

Detailed canopy vegetation maps at a scale of 1:20,000 have been produced for two major wetlands in the Missisquoi and Lamoille River Deltas of the Lake Champlain Basin, based on the interpretation of medium-high altitude color aerial photography. Photo interpretation was visual through use of a Bausch and Lomb Zoom 240 stereoscope. Signatures were established for a classification of thirteen canopy types. Species composition, relative dominance, canopy height and other characteristics of canopy associations are discussed. Ground control was achieved in summer of 1975 through a rigorous program of field survey. Methodology is carefully outlined for future studies of a comparative nature.

Descriptors: *Water resources, *Planning, *Land use, *Control, Population, Growth rate, Prices, Income, Urbanization, Mathematical models, Simulation analysis, Assessment, Alternative planning, Recreation, Aesthetics, Economics, Research priorities.
Identifiers: Consumer behavior, Preferences.

The patterns of land use and their relationship to urban water resources are examined from the point of view of population growth, consumer behavior, and preferences of price, income, and land use controls. The changes that need to be made in present social attitudes or water resources laws to satisfy the desired new developments are examined. Several implementation methods that are feasible and effective for changing urban development patterns are considered as well as models for assessing alternate development plans. The needs for research are outlined. It is concluded that very few projects look at the global interactions of patterns of urban development and urban water resources. The need is for a generalized systems analysis which integrates the urban planning process while promoting environmental quality and includes the feedback of the environmental impacts on the planning activities. Identifiers: *Hungary, *Cost minimization, Random search procedure, Flow-rate equalization, Water quantity.

Hungary has a rather changeable water supply situation, suffering periodically from the danger of inundation and the occurrence of water shortage; this has led to the conception of constructing storage reservoirs. Beside the agricultural needs, there exists a strong tendency toward the grow of industrial demands. This paper considers the problem of water resources management in an industrialized area of Hungary, the Sajo-region. A mathematical model is presented for planning a system of reservoirs for the purpose of low-flow augmentation. The computational solution to this problem is detailed, in connection with which a random search optimization procedure is presented. Finally, a possible comprehensive model of water resources management is designed, considering both quality and quantity aspects. (Bell-Cornell)

FLOOD PLAIN INFORMATION: KASKASKIA RIVER, BEAR CREEK, LAKE FORK CREEK, WEST FORK CREEK AND 'A' CREEK, DOUGLAS COUNTY, ILLINOIS, NO. 1.
Army Engineer District, St. Louis, Mo.
Prepared by Homer L. Chastain and Associates, Decatur, Illinois, for the County of Douglas, Illinois, February 1974. 36 p, 10 fig, 20 plates, 4 tab.

Descriptors: *Floods, *Flood stages, *Flow characteristics, *Flood plains, *Flood profiles, Flood flow, Flood data, Peak discharge, Channels, Channel improvement, Runoff, *Illinois.
Identifiers: *Kaskaskia River(IL), Bear Creek(IL), Lake Fork Creek(IL), West Fork Creek(IL), 'A' Creek(IL), Douglas County(IL), Chesterville(IL), Standard Project Flood, Intermediate Regional Flood, Flood plain management program.

Kaskaskia River, a tributary of the Mississippi River, flows through rolling, cultivated farmland in this study reach for 8.7 miles from its confluence with Lake Fork Creek to the Douglas - Coles County line. It falls .8 feet per mile. Its tributaries, Bear Creek, Lake Fork Creek, West Fork Creek, and 'A' Creek vary in slope from 1.9 to 3.5 feet per mile. Bear Creek and West Fork Creek consist partly of man-made improved channels, while the other two creeks are more meandering. Except for a small commercial development in Chesterville (IL), the flood plains, which vary from 1700 to 10,000 feet wide on the river and 400 to 7,000 feet on the creeks, are predominantly woods or farm lands. Floods occur during all seasons, particularly in the spring resulting from thunderstorms coupled with preceding periods of prolonged rainfall. Water stages rise quickly, usually within 8 hours, to flood levels. Natural obstructions and many of the 25 bridges over the river obstruct flood flows. The only flood damage reduction measures have been channel improvements on Bear, West Fork and 'A' Creeks. The highest recorded flood occurred in May 1943 when Lake Fork was reported as being the highest in 30 years and crops were washed out. Estimated peak discharges for an Intermediate Regional Flood and Standard Project Flood are 18,970 cubic feet per second and 23,530 cfs respectively at Douglas - Coles County line, and would inundate much of the flood plain. Channel velocities in the Kaskaskia River would vary between 1 and 6 ft/sec in an IRF, and would be slightly higher in an SPF. (Salzman-North Carolina)

Army Engineer District, Jacksonville, Fla.
Prepared for the City of Sanford and the Board of County Commissioners of Seminole County, July 1971. 25 p, 4 fig, 10 plates, 2 tab.

Descriptors: *Flood plains, *Floods, *Flow duration, *Flood profiles, Dams, Channel improvement, Storms, Flood data, Historic floods, Flood frequency, Erosion, Flood peak, Non-structural alternatives, Zoning, Flow characteristics, *Florida.
Identifiers: *Lake Monroe(FL), Sanford(FL), Seminole County(FL), St Johns River(FL), Intermediate Regional Flood, Standard Project Flood.

Lake Monroe is one of the larger lake components of the St. Johns River. The lake is 6 miles long, 4 miles wide and usually about 7 feet deep. This report is concerned with about 6 miles of the south shore. Sanford occupies a 2 mile reach of this shore which has flood plains extending 300 to 3,500 feet inland. The watershed above Sanford is 2,400 square miles of flat, poorly drained land. In the flood plain within Sanford are motels, commercial and government buildings, residences, utilities, and streets. Flooding occurs in late summer and early fall as the result of above normal rainfall. Local thunderstorms, over a period of several days and/or tropical storms can contribute to this rainfall. Damage from floods will occur when stages exceed 7 feet above mean sea level. Floods of this magnitude have occurred 9 times since 1920, the largest occuring in 1953 when flood stage reached 8.5 ft msl. Losses were $250,000. The Intermediate Regional Flood and the Standard Project Flood would reach 9.3 and 10.5 ft msl respectively. Large floods would rise at a rate of about 3 inches per day, and remain at or near peak stage for as much as 10 days to a month or more. Small reductions in flood stages and duration of flooding on Lake Monroe will occur when construction of the upper St. Johns River Project of the Central and South Florida Flood Control Project is completed. A concrete retaining wall built along part of the shoreline of the lake provides protection against erosion caused by wave action but not against flooding since the top of the wall is below 7 ft. Local building and zoning regulations are used to regulate construction in flood prone areas. (Henley-North Carolina)
W76-11342

FLOOD PLAIN INFORMATION: NORTHEAST VOLUSIA COUNTY, FLORIDA.
Army Engineer District, Jacksonville, Fla.
Prepared for the Board of County Commissioners of Volusia County, July 1971. 27 p, 10 fig, 3 plates, 3 tab.

Descriptors: *Storms, *Floods, *Tides, *Flood profiles, *Flood plains, *Hurricanes, Control structures, Flood stages, Flood duration, Erosion, Flood peak, Estuaries, Shores, Historic floods, Flood recurrence interval, Flood data, Flood frequency, *Florida.
Identifiers: Volusia County(FL), Daytona Beach(FL), Ormond Beach(FL), Holly Hill(FL), South Daytona(FL), Port Orange(FL), Halifax River(FL), Tomoka River(FL), Spruce Creek(FL), Hurricane parameters, Runup, S

dard Project Tidal Flood, Intermediate Regional Tidal Flood.

This report covers an urbanized area of about 130 square miles with a population of 80,000. It includes the cities of Daytona Beach, Ormond Beach, Holly Hill, South Daytona, and Port Orange. The Halifax River and its tributaries, Tomoka River and Spruce Creek, drain the area. Many small bridges and culverts, as well as insufficient capacities of drainage systems, can adversely affect flood plains. Flooding occurs after intense rainfall and high tides from occassional hurricanes. A hurricane has passed within 50 miles of Daytona Beach once every 9 years since 1900 and high tides have damaged urban development 3 times during that period. During a 1950 tropical storm 8 foot elevations were reached on the Halifax River. During an Intermediate Regional Tidal Flood, waters would reach 7 to 8.5 feet in the Halifax River and combined tide and runup could reach 16 feet along the ocean front. Standard Project Tidal Floods would reach 8 to 10 feet on the Halifax River and 20 feet along the ocean front. Maximum elevations would normally be reached 4 to 6 hours after the onset of hurricane winds and would affect 8,000 acres of urban land. Low bulkheading along the Halifax River and a fairly extensive canal system serve as some protection against floods. (Henley-North Carolina)
W76-11343

FLOOD PLAIN INFORMATION: SWIFT CREEK, MACON AND BIBB COUNTY, GEORGIA.
Army Engineer District, Savannah, Ga.
Prepared for the City of Macon and Bibb County, Georgia, June 1973. 30 p, 11 fig, 13 plates, 6 tab.

Descriptors: *Floods, *Flood plains, *Flood profiles, *Flood forecasting, *Flood stages, Flow duration, Flood flow, Storms, Hurricanes, Historic floods, Flood peak, Flow characteristics, Flood plain zoning, Warning systems, Obstructions to flow, *Georgia.
Identifiers: Macon(GA), Bibb County(GA), Swift Creek(GA), *Flood plain management, Ocmulgee River(GA), Jones County(GA), Intermediate Regional Flood, Standard Project Flood.

The study area encompasses about 11 square miles of Swift Creek watershed which lies in eastern Bibb and southern Jones Counties. Located near the City of Macon, Swift Creek is a tributary of Ocmulgee River and has narrow flood plains which are experiencing rapid commercial and industrial development along the highways and two railroads in the study area. Residential development is also occurring on the flood plain. Obstructions to flood flows include dams, some of the 9 bridges over Swift Creek, buildings, and vegetation. The City of Macon and Bibb County enacted flood plain zoning ordinances and are served by a flood warning system maintained by the National Weather Service and the local Civil Defense Office. Flooding can occur in any season and can result from general rainstorms, thunderstorms and hurricanes. Five large floods have occurred since 1916, the largest occurring in 1948 when a peak discharge of 83,500 cubic feet per second was reached on Ocmulgee River. The Intermediate Regional Flood and Standard Project Flood would have a peak discharge of 4,740 and 11,850 cfs, respectively, on Swift Creek. The IRF would typically rise 15 feet in 6 hours and remain above bankfull for 12 hours. Channel velocities could reach 10 ft/sec. Nine houses, 2 business establishments, roads, and utilities are within the 460 acres which would be flooded during an IRF. During the SPF 540 acres would be flooded. (Henley-North Carolina)
W76-11344

FLOOD PLAIN INFORMATION: WAYCROSS DRAINAGE CANAL, WAYCROSS AND WARE COUNTY, GEORGIA.
Army Engineer District, Savannah, Ga.
Prepared for Waycross and Ware County, Georgia, June 1969. 56 p, 36 fig, 22 plates, 17 tab.

Descriptors: *Canals, Floods, *Flood plains, Channels, *Flood profiles, Flow characteristics, *Flood forecasting, *Flood peak, Warning systems, Channel improvement, Flood stages, Historic floods, Storms, Hurricanes, Obstructions to flow, *Georgia.
Identifiers: *Waycross Drainage Canal(GA), Waycross(GA), Ware County(GA), Satilla River(GA), Intermediate Regional Flood, Standard Project Flood.

A tributary of the Satilla River, the Waycross Drainage Canal (with drainage area of 14.5 square miles) drains most of the city of Waycross in Ware County. Information on a 4.2 mile reach of Waycross Drainage Canal and on four tributaries which have a combined reach length of 3.2 miles is presented. Waycross Drainage Canal has a well defined channel and is surrounded by flat terrain. When flows exceed channel capacity, considerable development is subject to flooding. The entire flood plain is extensively developed with residential buildings, businesses, industry and commercial buildings. Vegetation and 33 bridges would obstruct flood flows of the Intermediate Regional Flood. The IRF would flood 450 buildings and 400 acres. Peak discharge would reach 1,510 cubic feet per second at the gage at City Boulevard with channel and overbank velocitie of 8 and 4 feet per second in the canal. IRF can be expected to rise 8 feet in 12 hours and remain above bankfull for 16 hours. The Standard Project Flood would flood 930 buildings and 810 acres. Peak discharge would reach 8,420 cfs with channel and overbank velocities of 10 and 5 feet per second respectively. SPF can be expected to rise 18 feet in 14 hours and remain above bankfull for 20 hours. The area is subject to general rainfloods and floods resulting from hurricanes. Building permits are required for all new construction, but Waycross and Ware County need flood plain regulations. (Henley-North Carolina)
W76-11345

FLOOD PLAIN INFORMATION: BUCK CREEK AND GRASSY CREEK, MARION COUNTY, INDIANA,
Army Engineer District, Louiville, Ky.
Prepared for Marion County Metropolitan Planning Department and Indianapolis Flood Control District, June 1973. 31 p, 14 fig, 11 plates, 7 tab.

Descriptors: Floods, *Historic floods, *Flood data, Flood stages, Flow characteristics, *Flood plains, *Flood protection, *Non-structural alternatives, Planning, Peak discharge, Flow duration, Flood plain zoning, Flash floods, *Indiana.
Identifiers: Buck Creek(IN), Grassy Creek(IN), Marion County(IN), Intermediate Regional Flood, Standard Project Flood, Cumberland(IN), Acton(IN), Subdivision regulations, Indianapolis(IN)

The study reach of this report includes 101 sq mi drained by Buck Creek on the east side of Indianapolis (IN) and 18.79 sq mi drained by Grassy Creek on the west side of Buck Creek. Both streams flow in a southerly direction with an average slope of 5.25 ft/mi. Their flood plains consist primarily of cropland and undeveloped land although development pressures are increasing. The 1970 population of Warren was 86,000 and is expected to reach 110,000 by 1980. Main flood season occurs January through April resulting from heavy rains; however, intense local storms can cause flash flooding. Channel velocities can range up to 15 ft/sec. Floods are generally short, lasting no longer than 48 hours. No flood control projects exist. Some channel improvement has been undertaken. A county-wide flood plain zoning ordinance regulates all construction in flood plains. Presently 24 bridges and natural vegetation obstruct the flood flow. Compared to the greatest known flood which occurred in May 1956 discharging 16,800 cubic feet per second on Buck Creek and 5,100 cfs on Grassy Creek, an Intermediate Regional Flood and a Standard Project Flood would have peak discharges of 21,000 cfs and 32,000 cfs respectively on Buck Creek. In an IRF a peak discharge of 5,800 cfs is predicted on Grassy Creek. (Salzman - North Carolina)
W76-11346

FLOOD PLAIN INFORMATION: KENAI RIVER, PHASE II, KENAI PENINSULA BOROUGH, ALASKA,
Army Engineer District, Anchorage, Alaska.
Prepared for the Kenai Peninsula Borough, Alaska, June 1975. 25 p, 12 fig, 18 plates, 3 tab.

Descriptors: Floods, *Flood flow, *Flood forecasting, *Flood profiles, Flood stages, *Ice jams, *Alaska, *Flood plains, Storms, Historic floods, Flood data, Flood frequency, Peak discharge, Stream erosion, Glaciation, Warning systems, Obstructions to flow, Runoff.
Identifiers: Kenai Peninsula Borough(AK), *Kenai River(AK), Jokulhlaup, Killey River(AK), Moose River(AK), Standard Project Flood, Intermediate Regional Flood.

'The portion of Kenai River included in this study extends from Moose River at Sterling, approximately ten miles upstream from the confluence with the Killey River, to the Moose Range boundary' and has a drainage area of 49 square miles. Most of the area is wilderness but there is ongoing residential and recreational development, and greatly increased development is expected. Obstructions to flood flows include vegetation, ice jams, docks and gravel pads extending into the river. Flooding can result from conventional storms runoff in summer and fall, the sudden release of glacier dammed waters (a phenomenon called a jokulhlaup), and spring ice jams and rapid snowmelts. Moderate damage was incurred during a flood in September, 1974, which reached a height of 184.2 feet and had a peak discharge of 26,800 cubic feet per second at Soldotna. An Intermediate Regional Flood will reach a height of 185.5 feet, have a peak discharge of 37,500 cfs at Soldotna and have channel velocities of 6.3 ft and overbank velocities of 3 ft. A Standard Project Flood will reach a height of 188.4 ft, have a peak discharge of 62,000 cfs, and have channel velocities of 7.2 ft. Flood flows cover only a small amount of overbank area with runoff from large storms modified by the regulating effects of Kenai Lake, Skilak Lake and lesser lakes and swamps in the watershed. Thus IRF and SPF discharges will create lower levels of flooding than ice jam created backwaters occuring under substantially smaller flows. Damage from IRF and SPF will effect residential and recreational development and agricultural land. There is a flood warning system in the area. (See also W74-01952) (Henley - North Carolina)
W76-11347

FLOOD PLAIN INFORMATION: FISHER CREEK, SANTA CLARA COUNTY, CALIFORNIA,
Army Engineer District, San Francisco, Calif.
Prepared for Santa Clara County Flood Control and Water District, July 1973. 18 p, 6 fig, 9 plates, 6 tab.

Descriptors: *Floods, *Flood forecasting, *Flood profiles, *Flood plains, Obstructions to flow, *California, Runoff, Overland flow, Streamflow forecasting, Historic floods, Flood data, Flood frequency, Peak discharge, Flood peak, Flow duration, Flood damage, Levees, Dikes, Reservoirs, Channel improvement.
Identifiers: *Fisher Creek(CA), Santa Clara County(CA), Coyote Creek(CA), Intermediate Regional Flood, Standard Project Flood.

LIBRARY U. OF I. URBANA-CHAMPAIGN

The properties in the flood plain are primarily agriculture and were inundated by the flood of 1955. Open spaces in the plain are already being subjected to pressure for development. The only industrial development is a mushroom plant. About 13.8 sq mi of an 18.3 sq mi basin contribute to basin runoff in the study area. The flat, alluvial valley through which the creek flows is poorly drained and partially depressed. The main flood season for Fisher Creek, a tributary of Coyote Creek, extends from October through April when flooding may be caused by intense rainfalls. A streamflow gage has been in operation on Fisher Creek for thirty years, with records revised in light of reservoir constructions in 1936 and 1950. During the 1955 flood 480 acres were flooded and $98,000 damage resulted. In the event of an Intermediate Regional Flood (IRF) peak flows of from 600 to 2300 cfs may be expected and in a Standard Project Flood (SPF) peak flows of up to 10,000 cfs are forecasted. The 1955 flood reached an elevation of 240.0 feet and in comparison 246.5 feet and 253.5 feet may be expected for the IRF and SPF respectively. These great floods would be expected to rise in 6.5 hours for the IRF with a flood stage duration of 13 hours and for an SPF a rise of 2.3 hours with flood stage duration of 38 hours. All of the bridges and culverts in the study area are obstructive to flow at the discharges that could be expected to accompany an IRF. Tentative plans have been made to improve flow protection of Fisher Creek. Some channel improvement and diking has already been carried out by local interests. (Smith - North Carolina)
W76-11348

FLOOD PLAIN INFORMATION: ALAMITOS CREEK, INCLUDING GUADALUPE CREEK-ARROYO CALERO AND SANTA TERESA CREEK, SANTA CLARA COUNTY, CALIFORNIA,
Army Engineer District, San Francisco, Calif.
Prepared for Santa Clara County, California, July 1973. 22 p, 12 fig, 14 plates, 7 tab.

Descriptors: Floods, *Flood flow, *Flood plains, *Flood stages, Flood protection, Flood forecasting, Flood profiles, Storms, Flood data, Flood frequency, Peak discharge, Flow characteristics, Erosion, Obstructions to flow, Reservoirs, *California.
Identifiers: Santa Clara County(CA), New Almaden(CA), *Alamitos Creek(CA), San Jose(CA), Guadalupe Creek(CA), Santa Teresa Creek(CA), Calero Creek(CA), Standard Project Flood, Intermediate Regional Flood.

Flooding along these creeks, with a total drainage area of 53 square miles, has historically caused damage to agricultural areas and urban development in the flood plains. Twelve damaging floods have occurred since 1930 when streamgages were installed on several of the creeks. The most significant flood, in April 1958, had a peak discharge of 4500 cubic feet per second and reached a gage height of 246.9 feet. An Intermediate Regional Flood would have a peak discharge of 6,400 cfs, reach a height of 250.4 feet, and have channel velocities up to 17 ft/sec and overbank velocities up to 4 ft/sec. A Standard Project Flood would have a peak discharge of 9,400 cfs and reach a height of 251.6 feet. An IRF would result in the inundation of residential and commercial establishments in New Almaden and San Jose. Floods rise to peak in less than 10 hours and remain at critical stage less than 1 day. The flood season is from October to April when floods result from intense rainstorms. Vegetation and many of the 36 bridges and culverts can obstruct flood flows. Three reservoirs in the area can limit the effects of flood waters. The Santa Clara County Flood Control and Water District has an Emergency Operations Center which coordinates flood warning and emergency activities. (Henley - North Carolina)
W76-11349

FLOOD PLAIN INFORMATION: DEER CREEK AND WHITE RIVER, EARLIMART, CALIFORNIA,
Army Engineer District, Sacramento, Calif.
Prepared for Tulare County, California, June 1971. 44 p, 26 fig, 32 plates, 7 tab.

Descriptors: *Flood stages, *Flood profiles, *Flood damage, Flood forecasting, *Flood plain zoning, Floods, Flood flow, Storms, Historic floods, Flood frequency, Peak discharge, Erosion, Flow duration, Deposition, Flood plains, Warning systems, Levees, Reservoirs, *California, Canals.
Identifiers: Earlimart(CA), Tulare County(CA), *Deer Creek(CA), *White River(CA), Standard Project Flood, Intermediate Regional Flood, Pixley(CA).

The portions of Deer Creek and White River covered in this report extend some 20 miles from State Highway 99 upstream to about the foothill line and have a drainage area of 470 square miles. Development in the area is largely agricultural with limited residential development around Earlimart and Pixley. Current population in the area is 4500. Vegetation, levees built by local landowners, 32 bridges and culverts, and the Friant-Kern Canal can obstruct flood flows. Tulare County has adopted a flood plain ordinance providing for secondary and primary floodways. There is an emergency warning system. Floods occur in November through March after exceptionally heavy rains. Historically they have caused heavy damage to orchards, farmland and irrigation systems. Damage resulting from the January 1969 flood was estimated at $1.5 million. An Intermediate Regional Flood would have a peak discharge of 14,000 cubic feet per second on Deer Creek and 7,800 cfs on White River, and have channel velocities reaching 9 to 12 feet per second and overbank flows of 2 to 4 ft/sec causing severe bank erosion. A Standard Project Flood would have a peak discharge of 20,000 cfs on Deer Creek and 10,200 cfs on White River. Floods can be expected to rise in .5 to 1 day and last from 1 to 3 days. (Henley - North Carolina)
W76-11350

FLOOD PLAIN INFORMATION: GREEN VALLEY, DAN WILSON, AND SUISUN CREEKS, CORDELIA, CALIFORNIA.
Army Engineer District, Sacramento, Calif.
Prepared for Solano County, June 1972. 38 p, 18 fig, 16 plates, 5 tab.

Descriptors: *Floods, *Flood profiles, *Historic floods, *Flood protection, Flood flow, Flood forecasting, Flood data, Winds, Tides, Flood frequency, Peak discharge, Flood peak, Flow duration, Bank erosion, Warning systems, Flood plain zoning, Levee, Channel improvement, *California.
Identifiers: Solano County(CA), Cordelia(CA), Green Valley Creek(CA), Dan Wilson Creek(CA), Suisun Creek(CA), Standard Project Flood, Intermediate Regional Flood.

The portions of Green Valley, Dan Wilson, and Suisun Creeks covered in this report have a drainage area of 76 sq mi located east of Napa, northeast of Valejo and due west of Fairfield in Solano County, CA. The area is largely agricultural (crops, orchards, and vineyards) with sparce commercial and residential development in and around Cordelia and Rockville. Area population is 2,000. The flood season is from November to May, the annual period of most intensive rainfall. Floods have historically been of moderate duration and have been most severe when rainfalls coincide with high tides and strong onshore winds. Since 1937 there have been 11 floods. The most severe occurred in 1955 when peak discharges on Suisun Creek reached 5,000 cubic feet per second resulting in streambank erosion and damage to orchards, croplands and livestock. An Intermediate Regional Flood would have a peak discharge of 6,100 cfs on Suisun Creek with channel velocities of 4.7 ft/sec and overbank velocities of 2.4 ft/sec. This flood would remain at peak for 3.5 hours. A Standard Project Flood would have a peak discharge of 7,200 cfs and last up to 11 hours. Twelve bridges, 6 culverts, 2 golf cart crossings and vegetation can obstruct flood flows. Three lakes in the drainage area reduce flood levels. Solano County has flood plain regulations and a flood control project (channel improvements and levees) has been completed along 4.5 miles of Green Valley and Dan Wilson Creeks. (Henley - North Carolina)
W76-11351

FLOOD PLAIN INFORMATION: CACHE LA POUDRE RIVER, COLORADO, VOL. III, FORT COLLINS-GREELEY-LARIMER-WELD COUNTY.
Army Engineer District, Omaha, Nebr.
Prepared for Larimer-Weld Regional Planning Commission, October 1975. 43 p, 16 fig, 19 plates, 9 tab.

Descriptors: *Floods, Flow characteristics, *Flood protection, Dams, *Attenuation, Flood stages, Flow duration, Flood plain zoning, Control structures, *Colorado.
Identifiers: *Cache La Poudre River(CO), Fort Collins(CO), Greeley(CO), Flood plain management, Larimer(CO), Weld County(CO), Intermediate Regional Flood, Standard Project Flood, Flooded areas.

Within this 24 mile reach the Cache La Poudre River flows southeasterly through a well-defined channel averaging about 10 feet deep and bordered by relatively flat flood plain of agricultural and wooded areas. Increasing pressure for development is expected especially at upstream and downstream study limits nearest Fort Collins and Greeley respectively. Primary flood season extends from May through September resulting from intense rainfall with snowmelt runoff a factor during May and June. Although no flood control structures exist in the study area, 2 upstream dams on the river have an effect on flood flow. Weld County has also enacted regulations governing development on the flood plain. Larimer County is expected to enact similar flood plain development regulations. The greatest recorded floods near Fort Collins occurred on June 9, 1891, having a peak discharge of 21,000 cubic feet per second and May 21, 1901, with a peak discharge of 12,000 cfs. Considerable flood discharge attenuation occurs along the river as a result of stream diversion dams which supply river water to irrigation canals, and of natural water storage in areas of intermittent depressions and embankments which occur on the flood plain. Tributary streams such as Boxelder Creek contribute to the flood hazard. Serious debris problems during a flood may be caused by trees and vegetation along the banks. An Intermediate Regional Flood and Standard Project Flood would have estimated peak discharges of 17,500 cfs and 41,000 cfs respectively at the upstream limit with 9,000 cfs and 26,400 cfs respectively at the lower study limits. (Salzman - North Carolina)
W76-11352

FLOOD PLAIN INFORMATION: WABASH RIVER, MIAMI COUNTY AND PERU, INDIANA.
Army Engineer District, Louisville, Ky.
Prepared for the Miami County Commissioners, the City of Peru and the Indiana Department of Natural Resources, June 1973. 33 p, 19 fig, 6 plates, 6 tab.

Descriptors: Floods, *Historic floods, *Flood plains, *Flood damage, Non-structural alternatives, *Flood profiles, Runoff, Flood flow, Flood data, Flood stages, Peak discharges, Flow characteristics, Flood protection, Flood plain zoning, *Indiana.

dentifiers: *Wabash River(IN), Miami County(IN), Peru(IN), Standard Project Flood, Intermediate Regional Flood, Flood plain management.

roperties along the river are primarily rural with esidential, commercial and industrial development in and adjacent to Peru, a trading and rocessing center for the surrounding agricultural rea. The study reach covers a distance of 13.6 iles with flood plains from 1.2 to 2.5 miles in idth. Floods occur during winter and spring esulting from runoff due to intense rainfall. Flood aters in upstream watershed are modified by 3 ood control reservoirs that control 77% of the asin area and reduce likelihood of severe flood-g. A flood wall, levees and railroad embankment rovide some protection. 'Most of the bridges in e study area are obstructive to the Intermediate egional Flood and the Standard Project Flood.' lthough the 1967 land use plan identifies flood lains to remain undeveloped, the City of Peru oes not include flood plain as a land use category hich results in conflict of zoning and building ermit approvals. The greatest flood occurred on arch 26, 1913 when a peak discharge of 115,000 bic feet per second was recorded and damages xceeded $2 million. Because of the reservoir's de-ntion of water, the peak discharges for an Inter-ediate Regional Flood (IRF) and Standard Pro-ct Flood (SPF) are estimated to be 33,200 cfs and ,300 cfs, respectively, inundating residential, mmercial and agricultural properties. The IRF ould crest in about two and a half days and main above bankfull approximately one day. e SPF would peak in about 5 days remaining out banks five days. (Salzman - North Carolina).
76-11353

LOOD PLAIN INFORMATION: POGUES RUN, LEASANT RUN, AND BEAN CREEK, ARION COUNTY, INDIANA.
my Engineer District, Louisville, Ky.
epared for Marion County, Metropolitan nning Department and Indianapolis Flood Con-l District, September 1970. 47 p, 17 fig, 11 tes, 12 tab.

scriptors: Floods, *Flood profiles, *Flood data, od stages, *Peak discharge, Flow charac-istics, *Flood erosion, *Flood plains, *Flood tection, Control structures, Flood flow, Histor-floods, Channels, Non-structural alternatives, diana.
ntifiers: Pogues Run(IN), Pleasant Run(IN), an Creek(IN), Marion County(IN), Indi-polis(IN), Standard Project Flood, Inter-diate Regional Flood.

gues Run, with a drainage of 8.87 sq mi, and asant Run, which drains 21.1 sq mi, flow in a thwesterly direction through Indianapolis. n Creek, drainage area 5.49 sq mi, flows west empties into Pleasant Run. The lower 2.23 es of Pogues Run is enclosed in an underground culvert. Flood plains have residential sections rspersed with industries, parks and cemeteries. od seasons are winter and early spring when eral heavy rains occur. Intense summer and fall derstorms also cause flooding. Stream veloci-may reach 10 feet per second in channel during or floods while overbank velocities seldom ex-l 4 ft/sec. Duration of flood is relatively short e rates of rise are generally high. An extensive d control project is proposed and partially for Pleasant Run and Bean Creek. State and l regulations prohibit floodway construction. greatest flood occurred in May 1956 when a discharge of 2,280 cubic feet per second was rded on Pleasant Run. During an Intermediate onal Flood peak discharges of 4,620 cfs, 6,920 and 3,420 cfs are predicted on Pogues Run, sant Run and Bean Creek respectively. During tandard Project Flood peak discharges of 00, 17,000 and 8,260 cfs are expected on the creeks. (Salzman - North Carolina)
-11354

FLOOD PLAIN INFORMATION: LICK CREEK AND LITTLE BUCK CREEK, MARION COUNTY, INDIANA.
Army Engineer District, Louisville, Ky.
Prepared for Marion County Metropolitan Planning Department and Indianapolis Flood Control District, June 1971. 38 p, 23 fig, 11 plates, 6 tab.

Descriptors: Floods, *Flood plains, *Flood plain zoning, *Flood profiles, *Flash floods, *Flood protection, Land uses, Obstruction to flow, Channel improvements, Flow characteristics, Historic floods, *Indiana.
Identifiers: Lick Creek(IN), Little Buck Creek(IN), Marion County(IN), Standard Project Flood, Intermediate Regional Flood.

The creeks of this study flow generally west and drain adjacent areas on the east side of the West Fork White River. Varying from 200 feet to 1500 feet wide, the flood plains have residential land uses, and undeveloped land. Past floods have inundated portions of this land. Strong residential growth in Perry Township, main basin areas of Lick and Little Buck Creeks, indicates increasing use of flood plain areas in the future. Floods from heavy rains occur primarily from January to April. Intense local thunderstorms can cause flash flooding during any season. Flood duration is relatively short in upper reaches where channel velocities could reach 12 feet per second on Lick Creek and 10 ft/sec on Little Buck Creek. Lower reaches may be flooded for longer periods due to back water effects from West Fork White River. Channel relocation and improvements have been completed on Lick Creek. State legislation requires prior approval of any construction on flood plains. Natural obstructions as well as 74 bridges and one dam could impede flood flow. The largest recorded flood was in July 1969 when 400-500 people in Marion and Johnson counties were forced to flee their homes. Estimated peak discharges for an Intermediate Regional Flood at the mouths of Lick Creek and Little Buck Creek would be 9,200 cubic feet per second and 9,600 cfs respectively. For a Standard Project Flood at the same location peak discharges are estimated at 17,500 cfs and 12,600 cfs respectively. (Salzman - North Carolina)
W76-11355

FLOOD PLAIN INFORMATION: LITTLE ARKANSAS RIVER AND SAND CREEK, SEDGWICK, KANSAS.
Army Engineer District, Tulsa, Okla.
Prepared for the City of Sedgwick, Kansas, April 1974. 31 p, 6 fig, 14 plates, 6 tab.

Descriptors: Floods, *Flood stages, *Flood plains, *Flood protection, Non-structural alternatives, Control structures, *Flood profiles, Runoff, Flood flow, Historic floods, Flood data, Peak discharge, Flow characteristics, Flood damage, Dams, Channel improvement, *Kansas.
Identifiers: Little Arkansas River(KS), Sand Creek(KS), Flood plain management, Sedgwick(KS), Standard Project Flood, Intermediate Regional Flood.

The study reach encompasses 10.5 miles of the Little Arkansas River, a major tributary of the Arkansas River, and 8.5 miles on Sand Creek, a left bank tributary of the Little Arkansas River, with a total drainage area of 1,200 square miles. In gently rolling farmland, the stream valleys are relatively flat with flood plain widths exceeding 2 miles. There are no flood control projects in the study area although Sand Creek has been cleared and enlarged above the study limits. Most floods occur in April through September with relatively fast runoffs in the upper reaches but slower flood runoffs in the lower reaches characterized by less steep slopes. Flows exceed channel capacity at least once a year. The highest known flood occurred on July 6, 1904. The greatest recorded flood, on June 9, 1965, had peak discharges of 9,800 cubic feet per second on Sand Creek and 18,000 cfs on the river. Estimated peak discharges for an Intermediate Regional Flood and Standard Project Flood are 63,000 cfs and 103,900 cfs, respectively on the Little Arkansas River and 17,750 cfs and 32,900 cfs on Sand Creek. With increasing development in the flood plains, now primarily agricultural, damages would be substantial. A proposed plan to build 3 flood water retarding structures and 19 detention dams is outlined. Other guidelines for a flood plain management program are suggested. (Salzman-North Carolina)
W76-11356

FLOOD PLAIN INFORMATION: BIG SANDY RIVER, BOYD COUNTY, KENTUCKY.
Army Engineer District, Huntington, W. Va.
Prepared for the Commonwealth of Kentucky, Department of Natural Resources, May 1972. 39 p, 9 fig, 10 plates, 4 tab.

Descriptors: Floods, *Flood profiles, *Flood plains, Levees, *Floodwalls, Floodwater, Flood flow, Historic floods, Warning systems, Reservoirs, *Kentucky.
Identifiers: *Big Sandy River(KY), Catlettsburg(KY), Lockwood(KY), Burnaugh(KY), Standard Project Flood, Intermediate Regional Flood.

As extensive developed lands lie in the flood plains of the Big Sandy River, large future floods could cause considerable damage to residences, businesses, industry (including an oil refinery, an activated carbon plant, and a chemical plant), and transportation facilities. The Big Sandy joins the Ohio River at Catlettsburg (population 3420 in 1970) and it is backwater effects from the Ohio which cause the most severe flooding. The Big Sandy has a drainage area of 4,290 square miles and is formed by the confluence of Levisa and Tug Forks 105 miles upstream from the Ohio River. Floods from heavy rainfall generally occur in months January through March. Numerous floods causing much damage have occurred on the Big Sandy. By far the largest was the 1937 flood when damage surpassed the sum of $1 million. Water rose 3.5 feet above the current Standard Project Flood level and 7 feet above the Intermediate Regional Flood level. No discharge records are available for these floods. For large floods water velocities of 8 feet per second in the channel and 3 feet per second in the overbank area are anticipated. An Intermediate Regional Flood is expected to rise to peak in 102 hours and last 10 days, while the Standard Project Flood would rise in 158 hours and last 14 days. In comparison, the 1937 flood rose in 274 hours and lasted 18 days. There are no significant obstructions to flood flow across the river. Future flood heights have been considerably reduced by reservoir projects upstream from Catlettsburg which is protected by levees and floodwalls. (Smith-North Carolina)

FLOOD PLAIN INFORMATION: QUINEBAUG RIVER - CADY BROOK, TOWN OF SOUTHBRIDGE, MASSACHUSETTS.
Army Engineer District, Waltham, Mass.
Prepared for the Town of Southbridge, February 1972. 41 p, 6 fig, 7 plates, 9 tab.

Descriptors: Floods, Streamflow forecasting, *Flood data, *Flood stages, Flow characteristics, *Flood plains, *Flood protection, Planning, *Massachusetts, Flood flow, Historic floods, Flow duration, Control structures, Reservoirs, Channel improvement, Dams, Flood profiles, Hurricanes.
Identifiers: *Quinebaug River(MA), Cady Brook(MA), Southbridge(MA), Intermediate Regional Flood, Standard Project Flood, Thames River Basin(MA).

Southbridge, located on the Quinebaug River in southcentral Massachusetts, rests in the upper

LIBRARY U. OF I. URBANA-CHAMPAIGN

portion of the Thames River Basin. Regulated by 2 dams above the study area, the Quinebaug River drains 744 square miles and flows southeasterly for 5 miles in the study reach through relatively narrow valleys with little development. Near Cady Brook, a tributary of the Quinebaug, there are some industrial and residential areas. Bridges do not generally obstruct flood flows and the 3 low dams allow flood flows to pass. Flooding occurs in the spring and results from heavy rains combined with snowmelt. However, the 2 highest floods resulted from hurricanes. Two reservoirs control 80% of the drainage area and will prevent serious flooding. Other flood damage prevention measures include widening and deepening of the channel of the Cady Brook and construction of concrete retaining walls. The greatest flood occurred in August 1955 and caused more than $18 million damages in Southbridge because of failure of the Glenecho Dam on Cady Brook and the Globe Tool and Die Company Dam on the Quinebaug River. The river had a peak discharge of 36,000 cubic feet per second. An Intermediate Regional Flood and Standard Project Flood would crest at 8.5 feet and 6.8 feet respectively, lower than the 1955 event and have peak discharges of 9,100 cfs and 13,500 cfs on the Quinebaug River at the Southbridge-Dudley town line. This report aids in the solution of local flood problems and in the best utilization of land subject to overflow. (Salzman-North Carolina)
W76-11358

FLOOD PLAIN INFORMATION: MERRIMACK RIVER, CITY OF CONCORD, NEW HAMPSHIRE.
Army Engineer District, Waltham, Mass.
Prepared for the City of Concord, New Hampshire, August 1972. 21 p, 7 fig, 8 plates, 6 tab.

Descriptors: Floods, *Flow duration, Flow characteristics, *Flood plains, *Flood protection, *Flood profiles, *New Hampshire, Historic floods, Flood data, Flood stages, Peak discharge, Rivers, Non-structural alternatives, Planning, Dams, Control structures.
Identifiers: *Merrimack River(NH), Concord(NH), Flood damage reduction measures, Intermediate Regional Flood, Standard Project Flood.

Located in south-central New Hampshire, the Merrimack River, in this study reach, meanders in a horse shoe shaped fashion toward the southeast for 9.8 miles with an average slope of .7 feet per mile. It drains 1,507 square miles above the study area. The flood plains, primarily agricultural areas with some residential and large commercial developments, are .75 to 1.5 miles wide. Floods occur during all seasons but usually result from spring snowmelt in combination with rainfall. Flood flow stages rise slowly and stay above flood stage for long periods of time with high velocities averaging 4 to 6 feet per second in the main channel. There are moderate quantities of floatable materials stored on the flood plains which may be carried away and obstruct bridge openings and damage structures. No flood plain regulations exist. The greatest known flood occurred on March 20, 1936, and had an estimated peak discharge of 122,000 cubic feet per second. Estimated damage was $500,000 in Concord. Other major floods occurred in September 1938, March 1953, April 1960 and April 1969. Beginning with the March 1953 flood, floods have been reduced in severity by regulation of Franklin Falls, Blackwater and Edward MacDowell Dams and Hopkinton-Everett Lakes. An Intermediate Regional Flood and Standard Project Flood would have peak discharges of 46,000 cfs and 92,800 cfs respectively. Damage could be extensive. During an IRF main channel velocities would be 4 to 6 ft/sec with slightly higher velocities in the SPF. Overbank velocities would average 1 to 2 ft/sec and would deposit debris and silt. (Salzman-North Carolina)
W76-11359

FLOOD PLAIN INFORMATION: ALUM CREEK, VICINITY OF COLUMBUS, OHIO.
Army Engineer District, Huntington, W. Va.
Prepared for the State of Ohio Department of Natural Resources, May 1967. 51 p, 14 fig, 8 plates, 2 tab.

Descriptors: Floods, Streamflow forecasting, *Flood data, *Flood plains, *Flood profiles, Peak discharge, Non-structural alternatives, Control structures, Obstructions to flow, Channel improvements, Historic floods, *Ohio.
Identifiers: *Alum Creek(OH), Columbus(OH), Intermediate Regional Flood.

Alum Creek's study reach covers a distance of 23 miles and passes through developed urban and suburban areas of the cities of Columbus, Bexley, and Westerville as well as rural land. Flowing southerly with an average slope of 7.4 feet per mile, the creek has relatively narrow flood plains varying from 300 to 3,000 feet wide. Three low dams and 26 bridges have a minor effect in obstructing flood flows. Channel improvements have been made in some areas and flood plain zoning regulations and flood plain restrictions have been adopted by Columbus and Franklin Counties. A multi-purpose reservoir on Alum Creek in Delaware County was authorized by Congress in 1962. Intended for flood control, water supply and recreation purposes, it should reduce cresting stage about 3 feet below the level of the March 1963 flood. The greatest flood occurred January 22, 1959, cresting at 753.2 feet means sea level (gage zero is 733.62 msl) with an estimated discharge of 26,400 cubic feet per second. Communities in Alum Creek valley were unprepared for the rapid rise of flood waters and suffered extensive flooding over large areas. Damages were $3 million (1959 prices). An Intermediate Regional Flood would be expected to crest at 752.0 feet and have a peak discharge of 22,500 cfs. Structural improvements, reservoirs, levees, flood walls, watershed treatment and planning techniques including zoning subdivision regulations, urban renewal and establishment of open space lands are discussed. (Salzman-North Carolina)
W76-11360

FLOOD PLAIN INFORMATION: SOUTH FORK RIVANNA RIVER, ALBEMARLE COUNTY, VIRGINIA.
Army Engineer District, Norfolk, Va.
Prepared for the Albemarle County Board of Supervisors, March 1973. 18 p, 10 fig, 11 plates, 5 tab.

Descriptors: Floods, *Flood control, *Flood plains, *Flood profiles, Flood protection, *Virginia.
Identifiers: *South Fork Rivanna River(VA), Albemarle County(VA), Charlottesville(VA).

South Fork Rivanna River, northwest of Charlottesville, has a drainage area of 268 square miles. It joins the North Fork to form the Rivanna River which flows 41.55 miles before emptying into the James River. The average slope of the South Fork is 6.6 feet per mile while its tributaries which reach into the Blue Ridge Mountains have much steeper slopes. The narrow flood plain is wooded or open farm land and undeveloped except for several small dams which do not provide flood control. Floods occur during all sons caused by rainfall as well as hurricane activity or from snowmelt in combination with rainfall. The greatest flood, in October, 1942, occurred when about 10 inches of rain fell on the Rivanna River watershed in 3 days as part of a hurricane approached the area, creating extensive flooding in Charlottesville. The most recent flood on February 18, 1960, crested at 12 feet with peak discharge of 6,010 cfs. No flood damage reduction measures exist. An Intermediate Regional Flood (IRF) and Standard Project Flood (SPF) would result in the inundation of mostly agricultural land with peak discharges of 53,400 cfs and 90,000 cfs respectively. Velocities for the SPF will be even higher, possibly reaching 22 ft/sec. Flood stage duration will be 27 hours for IRF, 59 hours for an SPF. This report is to assist in land use planning and in preparing ordinances concerning flood plain utilization, since future development in the area around Charlottesville may encroach on the delineated flood plain. (Salzman-North Carolina)

SNOWMELT RUNOFF FROM PLANTED CONIFERS IN SOUTHWESTERN WISCONSIN.
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
R. S. Sartz, and D. N. Tolsted
USDA Research Note NC-205, 2 p, 1976. 4 ref, 2 tab.

Descriptors: *Snowmelt, *Runoff, *Forest watersheds, *Wisconsin, *Conifers, Snowpack, Overland flow, Pine trees, Watersheds(Basins), Frost, Infiltration, Slopes
Identifiers: Red pine(Pinus resinosa), Norway spruce(Picea abies), European larch(Larix decidua), Spruce trees, Larch trees

Snowmelt overland flow was measured for one season from 10-year-old plantations of red pine (Pinus resinosa), Norway spruce (Picea abies), European larch (Larix decidua), and from old field control plots, on both north and south slopes, in southwestern Wisconsin. Pine and spruce plots produced more runoff than larch and old field plots; and south slope plots produced more runoff than north slope plots. (Witt-IPC)

BENEATH THE TENN-TOM,
Geological Survey, Nashville, Tenn.
J. Van Brahana.
Water Spectrum, Vol 7, No 4, p 17-24, Winter 1975-76.

Descriptors: *Baseline studies, *Water resources, *Water quality, *River training, *Tennessee River, Projections, Surface waters, Groundwater, Construction, Inland wateways, River systems, Ships, Hydrologic systems, Environmental effects, Data collections, Evaluation.
Identifiers: *Tennessee-Tombigbee Waterway project.

A new waterway soon will connect the inland Tennessee River system with the Gulf of Mexico via the Black Warrior Waterway, shortening some shipping distances as much as 800 miles and extensively modifying the surface-water flow characteristics over a 2,000-square-mile area. Test holes were drilled at strategic locations along the proposed route to aid in defining the existing flow system. Some of the changes in the water quality of surface water that may occur during construction and others that may result from subsequent operation activity include: increase in sediment loads, increase in turbidity, pH change in vicinity of fresh cuts, thermal stratification in deep impoundments, introduction and concentration of minor metals, decrease in dissolved oxygen, increase in wastes from developing areas, change in nutrient loading, and contamination from accidental spills of material being transported. Some of these effects on the quality of the surface wa

may be transmitted to interconnected aquifers and thereby change ground-water quality. Water levels will be raised along 90 percent of the waterway, enhancing opportunities for ground-water development in adjoining areas. In the remaining 10 percent, which is the cut in the divide section, water levels will be lowered about 100 feet adjacent to the cut near its midpoint but closely approach the original levels at the north and south ends of this reach. RIPARIAN DENDROCHRONOLOGY: A METHOD FOR DETERMINING FLOOD HISTORIES OF UNGAGED WATERSHEDS,
Arizona Univ., Tucson. Lab. of Tree-Ring Research.
C. W. Stockton, and D. Laing.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 967, $3.50 in paper copy, $3.00 in microfiche. Completion Report, August 1976. 18 p, 4 fig, 4 tab, 10 ref. OWRT A-058-ARIZ(1). 14-34-0001-6003.

Descriptors: *Dendrochronology, *Flood damage, *Flood frequency, *Land use, History, Dating, Snowpack, Plant growth, Watershed management, Arizona, Utah, Colorado.
Identifiers: *Crossdating, *Riparian zone, *Tree growth.

Examination of 106 crossdated tree-ring cores from the riparian zone of Pine Creek near Escalante, Utah, 10 cores from Bright Angel Creek, Grand Canyon, Arizona, 8 cores from South Taylor Creek, Zion National Park, Utah, and 5 cores from the Animas River near Silverton, Colorado, has yielded the following information: (1) Various riparian gymnosperm and angiosperm species crossdate with semi-arid site gymnosperms. (2) Tree growth is best correlated with snowpack water equivalent. (3) Flood damage to trees is manifested in growth suppression on root exposure or burial, in reaction wood on tilting, and in scarring. (4) Flood damage is very infrequent at Pine Creek from 1700 to 1880, more so from 1880 to 1909, and very frequent from 1909 to the present. (The town of Escalante was settled in 1875, and stocking of the range around Pine Creek reached a maximum shortly after 1900). (5) Flood damage shows fairly constant frequency in the Bright Angel Creek watershed, which has seen little land use. (6) Flood damage on South Taylor Creek shows a marked increase in frequency between about 1900 and 1937 when the region was included in Zion National Monument, after which flood damage declined markedly in frequency.

UNDERGROUND STORAGE OF STATE WATER PROJECT SUPPLY, A PROGRESS REPORT,
Los Angeles City Dept. of Water and Power. Aqueduct Div.
D. L. Georgeson.
In: Proceedings, Tenth Biennial Conference on Ground Water, September 11-12, 1975, Ventura, California, p 9-11.

Descriptors: *Storage capacity, *Underground storage, *Groundwater basins, Pumped storage, Resource development, Groundwater, Wells, Groundwater mining, *California.
Identifiers: State Water Project, *Dewatered aquifers, *Groundwater basin inventory, Groundwater basin storage capacity, Pumping facilities, Southern California.

During the last two years, the Southern California Water Conference has studied the engineering, legal and institutional feasibility of implementing the storage of State Water Project supplies in the dewatered space available in southern California's ground water basins. A basin-by-basin inventory was taken to determine the capability of each ground-water basin to store State Project water. The inventory indicated that approximately 4,535,000 acre-feet of dewatered basin capacity was available. In addition it was determined that there was approximately 4,582,000 acre-feet of water already in storage in ground-water basins which could be extracted using present facilities, and approximately 3,573,000 acre-feet of water which could be extracted with modification of present-day facilities. A coincident study entitled 'Ground Water Storage of State Water Project Supplies' reported that the State Water Project had the capability to convey 2,610,000 acre-feet of State Project water to southern California during the period 1975 through 1982. A third activity was the work of a legal and institutional subcommittee which drafted an agreement for delivery and use of State Project water. (Heiss-NWWA)

TOWARDS A COMPUTER-BASED INFORMATION MONITORING SYSTEM FOR GROUNDWATER DATA IN NEW ZEALAND,
Illinois Univ. at Chicago Circle. Dept. of Geological Sciences.
R. B. McCammon.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 31-6-1 - 31-6-5. 2 fig, 4 ref.

Descriptors: *Data storage and retrieval, *Computer programs, *Data collections, *Groundwater, *Water quality, Data processing, Wells, Water sampling, Monitoring.
Identifiers: *New Zealand.

The development of a computer-based information retrieval system for groundwater data in New Zealand is discussed. Currently there are over 20,000 water well records on file in New Zealand dealing with information obtained from drilling, subsequent test pumping, and water quality analyses. Thus, the need exists for developing a computerized storage and retrieval system. Three types of computer dialogues are currently being considered: question-and-answer types, menu-selection types, and natural-English dialogues. The importance of involving potential users in the development of the groundwater information system is stressed. (See also W76-10637) (Kreager-FIRL)

GEOPHYSICAL PROSPECTING FOR GROUND WATER IN ALASKA.
Geological Survey, Denver, Colo.
H. Ackermann
Geological Survey Earthquake Information Bulletin, Vol 8, No 2, p 18-20, March-April 1976. 4 fig.

Descriptors: *Geological surveys, *Groundwater resources, *Alaska, *Seismic studies, *Electrical resistance, Explosives, Exploration, Seismographs, Locating, Groundwater, Water supply, Methodology.

For several years the U. S. Geological Survey has been assisting the Air Force in locating water supplies in frozen areas of Alaska. Two geophysical prospecting methods, seismic refraction and electrical resistivity, complement each other in exploring for ground water in frozen areas because both electrical resistivity and seismic velocity have large values in frozen earth. Similarly, velocities and resistivities are high in areas of shallow unfractured rock. Consequently, areas of frozen earth and unfractured (nonporous) rocks are to be avoided for a potential water supply. The trick then is to locate subsurface zones of lower seismic velocity and electrical resistivity because these are likely water reservoirs. These layers may be water-saturated permeable rock, glacial material, alluvium, or fault gouge. Once located, such zones are prospected in great detail so that a precise location for a drill hole or gallery can be recommended. (Woodard-USGS)

4C. Effects On Water Of Man's Non-Water Activities

THE IMPACT OF SUBURBANIZATION ON STREAM NETWORKS,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
W. L. Graf.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-256 22[illegible] $4.00 in paper copy, $3.00 in microfiche. Final Report 14, (ISWRRI-75), June 1976. 34 p., 7 fig., tab, 23 ref. OWRT A-059-IA(1).

Descriptors: *Streams, *Iowa, *Urbanization, *Hydrographs, Channels, Open channels, Cities, *Suburban areas, Networks, Drainage basins, Flash floods.
Identifiers: Iowa City(Iowa), *Channel networks, Kurtosis, Storm hydrographs.

nalysis of geomorphic, hydrologic, and suburnization data from a small instrumented ainage basin near Iowa City, Iowa, indicates that annel networks are radically altered when subban development overtakes a drainage basin. ange in channel networks are generally such at the network becomes much more efficient in llecting water quickly, so that lag time and kursis of storm hydrographs are altered to produce e familiar flash floods of urban areas. The data ow that network change are most closely asciated with kurtosis of storm hydrographs, and ggest that corrective measures be concentrated the internal linkages of the network.

FECT OF PLANTATION ESTABLISHMENT SOIL AND SOIL WATER IN UTHWESTERN WISCONSIN,
est Service (USDA), St. Paul, Minn. North tral Forest Experiment Station.
. Sartz.
DA Research Paper NC-127, 8 p, October. 5. 2 fig, 20 ref, 7 tab.

criptors: *Groundwater, *Soil moisture, atershed management, *Forest watersheds, trees, *Wisconsin, Soil density, Soil chemis- Soils, Carbon, Nitrogen compounds, Surface off, Freezing, Springs, Streamflow, Erosion rol, Soil water, Snowmelt, Snowpack, Slopes, ifers, Storm runoff.
tifiers: Eastern white pine(Pinus strobus), pine(Pinus resinosa), White spruce(Picea ca), European larch(Larix decidua), Spruce s.

tations of eastern white pine (Pinus strobus), pine (P. resinosa), white spruce (Picea glauca), European larch (Larix decidua) were blished on three sites in southwestern Wisconnd the changes in letter weight, soil bulk den- soil nitrogen and organic carbon contents, water depletion, and snowpack accumulation evaluated over 14 years of growth. The sites ded an upper northern slope of 10 percent, a r north slope of 25 percent, and a middle n slope of 25 percent. The greater amounts of that built up under larch would seem to make preferred species for watershed management ing; however, the additional litter may have alue in preventing rainfall runoff. It may ce soil freezing, which could reduce snowmelt ff. The plantations are not yet old enough to reduced soil bulk density. By the 10th year, ine and larch plantings were using substan- more water from the top meter of soil than nplanted control, and a little more than a al hardwood forest. The additional water depleted by the trees can reduce flood runoff potential from summer storms, but on the other hand, this may reduce the contribution to groundwater, springflow, or stream base flow, which would have a negative effect of water production. (Witt-IPC)

PROBLEMS IN ANALYSES OF ORGANIC POLLUTANTS IN OPEN-OCEAN SAMPLES,
Texas A and M Univ., College Station. Dept. of Chemistry.
C. S. Giam, H. S. Chan, and G. S. Neff.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 21-1-1 - 21-1-3. 3 tab, 3 ref.

Descriptors: *Pollutant identification, *Organic compounds, *Analytical techniques, *Sampling, Equipment, *Quality control, *Sea water, DDT, Polychlorinated biphenyls, Chlorinated hydrocarbon pesticides, Water analysis.
Identifiers: Phthalate ester plastizers, Sample collection, Laboratory reagents.

Techniques for avoiding the contamination of open-ocean samples during collection and analysis for organic pollutants are discussed. General precautions against contamination include: concentrating an aliquot of each bottle of reagent used in the procedure; the removal of organics from laboratory tap water by liquid-liquid extraction; the cleaning of solid reagents by heating; the purification of gases used to evaporate solvents by passage through a molecular sieve or other suitable trap; the use of equipment made from glass, teflon, or metal; the avoidance of materials made from plastics, rubber, and cork; the use of a minimum amount of equipment; and the performance of frequent procedure blanks. Selected results of analyses performed on samples from the Gulf of Mexico are presented for DDT, polychlorinated biphenyl, and phthalate ester plastizers to illustrate the efficacy of such precautions. THE MEANING AND MEASUREMENT OF TURBIDITY,
National Oceanographic Instrumentation Center, Washington, D.C.
B. S. Pijanowski.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 21-6-1 - 21-6-5. 6 fig, 13 ref.

Descriptors: *Analytical techniques, *Turbidity, *Water quality, *Optical properties, *Suspended solids, Physical properties, *Measurement, Instrumentation, Equipment, Calibrations.
Identifiers: Transmissometers, Nephelometers, Ambient light meters, Jackson candle turbidimeter.

Problems associated with the use of turbidity as an optical indicator of water quality are discussed along with recommendations of a workshop on turbidity sponsored by the National Oceano-

LIBRARY U. OF I. URBANA-CHAMPAIGN

graphic Instrumentation Center. The term turbidity is recommended for use only as a qualitative descriptor and not as a parameter for measurement. The concept of turbidity is optical and in a broad sense is an indication of suspended particulate matter. A single optical measurement cannot be used to measure suspended particulates in general because the optical characteristics of the particulates are complex functions of particle size and shape, absorption, and other parameters. It is recommended that when optical measurements are made they be identified with the type of instrument used and that the instruments not be calibrated in artificial units as is the common practice currently. Conceptual descriptions of the following types of turbidity measuring instrumentation are provided: the Jackson Candle turbidimeter, transmissometers, nephelometers, and ambient light meters. Accepted methods for turbidity measurements and instrument calibration are also outlined. (See also W76-10637) (Kreager-FIRL)
W76-11240

THE ENVIRONMENTAL INFORMATION SYSTEM (EIS) IN SWEDEN AND MONITORING OF THE ENVIRONMENT,
Swedish Council of Environmental Information, Stockholm. Jordbruksdepartementet.
I. Palmlund, and I. Andersson.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 25-2-1 - 25-2-3. 1 fig, 1 tab.

Descriptors: *Data collections, *Data processing, *Information retrieval, *Monitoring, Programs, Measurement, *Pollutant identification, Methodology, Environment.
Identifiers: *Sweden, *Environmental information systems.

The structure of the Swedish Environmental Information System is outlined. The system is designed to provide coordinated and standardized data collection concerning air, water, and ground quality in both polluted and unpolluted areas. Information concerning products and chemical substances subject to control, major polluting sources, and research and data collection activities throughout the country is also provided by the system. The development of the Environmental Information System is now in progress under the direction of the Swedish Council of Environmental Information which is also planning a study of the coordinated utilization of the Environmental Information System and meteorological, hydrological, and other data bases. (See also W76-10637) (Kreager-FIRL)
W76-11241

ANALYSIS OF ORGANIC POLLUTANTS IN DRINKING WATER,
Drexel Univ., Philadelphia, Pa. Dept. of Chemistry.
I. H. Suffet, and J. V. Radziul.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 30-1-1 - 30-1-7. 5 fig, 4 tab, 23 ref.

Descriptors: *Analytical techniques, *Separation techniques, *Pollutant identification, *Potable water, *Organic compounds, Gas chromatography, Mass spectrometry, Ethers, Water analysis.
Identifiers: Chlorinated hydrocarbons, Aromatic hydrocarbons, Chloroform, Trichloroacetone, Acetones, Chlorinated alkanes, Precursor compounds, Bis(2-chloroethyl)ether, Benzenes.

Isolation techniques and analytical method for the determination of organic compounds in drinking water are discussed. Isolation techniques covered include: liquid-vapor phase isolation in the form of head gas analysis, liquid-liquid phase isolation in the form of solvent extraction, liquid-solid phase isolation in the form of carbon adsorption, and absorption by macroreticular resins. Analytical approaches are discussed in terms of quantitative and general screening methods. The development of quantitative analysis techniques for bis(2-chloroethyl)ether, chloroform are described along with the use of gas chromatography/mass spectrometry for the identification of organic compounds in Philadelphia drinking water. A list of 20 organic compounds found in the drinking water is presented and reveals the presence of 1,1,1-trichloroacetone, a precursor of chloroform. A constant background of hydrocarbon substituted benzene and chlorinated alkanes is also observed for the drinking water sample. (See also W76-10637) (Kreager-FIRL)
W76-11242

FLUORESCENCE MEASUREMENTS OF CARCINOGENIC AND POLYCYCLIC AROMATIC HYDROCARBONS IN WATER,
National Bureau of Standards, Washington, D.C. Inst. for Materials Research.
F. P. Schwartz, and S. P. Wasik.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 30-2-1 - 30-2-5. 5 fig, 10 ref.

Descriptors: *Fluorescence, *Spectrophotometry, *Pollutant identification, *Aromatic compounds, Analytical techniques, Feasibility studies, Evaluation, Sea water, Water analysis.
Identifiers: *Polynuclear aromatic hydrocarbons, *Carcinogens, Naphthalene, Anthracene, Pyrene, Fluoranthene.

The feasibility of using fluorescence spectrometry for determining carcinogenic and polycyclic aromatic hydrocarbons in water was investigated. At naperian absorbances of less than or equal to 0.05, the fluorescence intensities of solutions containing naphthalene, anthracene, pyrene, and fluoranthene in water were a superposition of the component fluorescence spectra. The fluorescence spectra varied unpredictably with concentration when viewed perpendicular to the excitation light and at higher polynuclear aromatic optical densities in the mg/liter range. Polynuclear aromatic fluorescence intensity was not affected by the presence of sodium chloride at sea water concentrations or by the presence of mg/liter concentrations of iron, zinc, cobalt, or nickel cations in water. (See also W76-10637) (Kreager-FIRL)
W76-11243

MONITORING FOR ORGANIC POLLUTANTS IN GREAT BRITAIN,
Analysis Automation Ltd., Oxford (England).
A. Verdin.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 30-3-1 - 30-3-3. 5 fig, 19 ref.

Descriptors: *Monitoring, *Water quality, *Effluents, *Organic compounds, *Analytical techniques, Instrumentation, Equipment, Measurement, Biochemical oxygen demand, Chemical oxygen demand, Carbon, Gas chromatography, Mass spectrometry, Ultraviolet radiation, Oil, *Pollutant identification.
Identifiers: Great Britain.

Water and air pollution monitoring activities in Great Britain are reviewed. Although the basic parameter in British water treatment is the 5-day biochemical oxygen demand value which is not amenable to adaption for continuous monitoring, a number of commercial systems for chemical oxygen demand and other measurements are being used for effluent monitoring. A simple on-line device which uses the correlation between total organic carbon or biochemical oxygen demand and ultraviolet absorption at 254 nanometers has also been developed. An oil-in-water monitor which uses the single beam ultraviolet absorption principle and sophisticated sample conditioning system is being used at a North Sea oil facility. Extensive multiparameter water quality networks are being developed in Britain, although they do not include any organics monitors yet. Individual organics are analyzed in grab samples by gas chromatography and mass spectrometry. (See also W76-10637) (Kreager-FIRL)
W76-11244

ENVIRONMENTAL INDICES AND MONITORING,
Department of the Environment, Ottawa (Ontario). Science Policy Branch.
H. Inhaber.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 31-1-1 - 31-1-3. 6 ref.

Descriptors: *Monitoring, *Data collections, *Data processing, *Indicators, Measurement, Evaluation, Analytical techniques, Environment, *Pollutant identification.
Identifiers: Environmental indices.

The usefulness of environmental indices is discussed along with their relationship to monitoring. Environmental indices compare the actual state of part of the environment to a desirable standard. Since indices are only as good as the data on which they are based, their usefulness depends on adequate and accurate monitoring facilities. The use of environmental indices can indirectly diminish problems associated with overlapping monitoring policies and networks since they provide a goal for monitoring activities. Indices also tend to speed up the processing and reporting of environmental data since their purpose is to inform the public on the state of the environment. Since environmental indices tend to regularize the collection of data, problems associated with assessing the synergistic effects of pollutants are diminished by the use of indices. X-RAY DIFFRACTION AND ELECTRON BEAM ANALYSIS OF ASBESTIFORM MINERALS IN LAKE SUPERIOR WATERS,
National Water Quality Lab., Duluth, Minn.
P. M. Cook, I. B. Rubin, C. J. Maggiore, and W. Nicholson.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 34-1-1 - 34-1-9. 7 fig, 1 tab, 12 ref.

Descriptors: *Asbestos, *Lake Superior, *Electron microscopy, *Potable water, *X-ray diffraction, *Pollutant identification, Industrial wastes, Mineral industry, Solid wastes, Analytical techniques, Lakes.
Identifiers: *Asbestiform amphibole fibers, Taconite tailings.

Electron microscopic and X-ray diffraction analyses of asbestiform amphibole fibers in Lake

Superior water are reported. The lake, which is used for municipal water supplies, contains large concentrations of asbestiform minerals as a result of a taconite tailings discharge at Silver Bay, Minnesota. Daily X-ray diffraction studies and occasional transmission electron microscope measurements of Duluth, Minnesota drinking water samples revealed amphibole fiber counts per liter of water ranging from 10-1000 million, with the average being 45-100 million. Not all of the amphibole fibers present can be identified due to their extremely small width. Large fluctuations in fiber concentrations are attributable to seasonal and meteorological changes which influence Western Lake Superior water circulation. Variations in electron microscope amphibole fiber counts generally correspond to variations in amphibole mass concentration determined by X-ray diffraction. (See also W76-10637) (Kreager-FIRL)

BACTERIA AND PHOSPHORUS AS INDICATORS OF THE EXTENT OF A LARGE SEWAGE SPILL IN LAKE ERIE,
Canada Centre for Inland Waters, Burlington (Ontario).
N. M. Burns, H. R. van Otterloo, and B. J. Dutka.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 493-500, 1974. 4 fig, 4 tab, 9 ref.

Descriptors: *Sewage, *Sewage bacteria, *Phosphorus, *Lake Erie, Bacteria, Coliforms, Streptococcus, Dissolved oxygen, Sewage effluents, Wastes, Pollutants, Water pollution, Water pollution effects, Path of pollutants, Lakes, Epilimnion, Hypolimnion, Surveys, Limnology.
Identifiers: *Sewage spills.

On June 21, 1971, a sewage treatment plant in Cleveland, Ohio, broke down and discharged 19,000 cu m/hr of raw sewage for approximately ten days. Immediately after the spill ceased, water samples from the epilimnion and hypolimnion were collected from the surrounding U.S.A. waters and across the international boundary. These samples were analyzed for coliforms, fecal coliforms, fecal streptococci, dissolved oxygen, particulate organic carbon, and total filtered and total unfiltered phosphorus. From the collected data, and comparisons with earlier Lake Erie data, it was found that only coliforms and phosphorus values were affected by the discharge at the time of the study with coliforms providing the only clear indication of the extent of the spill. Coliform data indicated that the sewage discharge affected bacterial populations up to and across the international boundary line. The failure of phosphorus values to detect the extent of the spill and the use of coliform bacteria to define the boundaries of the plumes were discussed. (See also W76-11275) (Sims-ISWS)

AN INVESTIGATION OF THREE METHODS FOR THE DETERMINATION OF SUBMICROMOLAR ION CONCENTRATIONS IN WATER,
Wisconsin Univ., Madison. Dept. of Chemistry.
W. J. Blaedel, G. W. Schieffer, R. A. Niemann, and D. E. Dinwiddie.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 579, $4.50 in paper copy, $3.00 in microfiche. Wisconsin Water Resources Center, Madison Technical Report WFS WRC 76-01, June 1976. 44 p, 1 tab, 23 fig, 32 ref. OWRT A-053-WIS(5) 14-31-0001-4050 14-31-0001-5050.

Descriptors: *Pollutant identification, Methodology, Sampling, *Ion exchange, *Copper, *Electrodes, *Speciation, Trace elements, Analytical techniques, Water analysis.
Identifiers: *Trace metal ions, *Ion-selective electrodes, *Copper ions, Tubular electrodes, Anodic stripping voltammetry.

Two methods were studied for the sampling, concentration, or determination of trace metal ions at submicromolar levels. 1. Trace ions in a sample donor solution are concentrated by loading upon a pellicular ion exchanger, and these are eluted or stripped into an acceptor solution at an enhanced concentration level so that they can be more easily measured. In studies with Cu(II), enhancements up to 64-fold have been obtained that are in accord with the theoretical Donnan enchancement. Times required are reasonable, being about a half hour for the loading step and about five minutes for the stripping step. Equipment and procedure are being designed to permit estimations of copper ion concentration or activity (speciation) in the field. 2. With sample solution flowing through two tubular electrodes in series, trace metal ions may be deposited cathodically at the upstream electrode, and then stripped off by scanning the upstream electrode toward anodic potentials. With the proper control of conditions, and with the downstream electrode maintained at a constant cathodic potential, collector currents due to metal ions stripped from the upstream electrode can be measured at the downstream electrodes and used for estimating the trace metal ion concentration in the original sample solution. Although the collector currents are smaller than the stripping currents they are observed against a very low and steady background current, in contrast to the high and varying background charging currents observed at the stripping electrode. An expression for the dependence of stripping and collector currents upon deposition time, solution flow rate, etc. has been derived and tested.

IDENTIFICATION OF STABLE ORGANIC COMPOUNDS IN WASTE EFFLUENT,
Connecticut Univ., Storrs. Inst. of Water Resources.
R. P. Collins.
Available from the National Technical Information Service Springfield Va 22161, as PB-256 562, $3.50 in paper copy, $3.00 in microfiche. Completion Report June 1976. 11 p, 4 tab, 2 fig. OWRT A-053-CONN(1), 14-31-0001-3807.

Descriptors: *Organic compounds, *Chlorination, Wastewater treatment, Gas chromatography, Mass spectrometry, Analytical techniques, *Pollutant identification, Organic wastes, Effluents, Infrared radiation, Chemical wastes, Phenols, Sludge, *Industrial wastes.
Identifiers: *Purifax process, *Infrared spectrometry, Textile industry wastes.

Laboratory investigations to identify the refractory organic chemicals released in the wastewater of local textile plants and to determine the fate of these compounds after the wastewater treatment process were carried out. Effluents and sludge from a Purifax Water Treatment Plant were analyzed by gas chromatography infrared and mass spectrometry. Chemical reagents, including ortho phenylphenol, para phenylphenol, biphenyl and methyl salicylate, which are utilized by the textile industries using the Purifax facility were subjected to chlorination and analyzed. Over one hundred compounds were detected by gas chromatography in effluent and sludge obtained from the Purifax plant. Many of the compounds utilized in the textile industry readily chlorinated and could be detected in both the effluent and sludge obtained from the treatment plant. (de Lara-Connecticut)

LIBRARY U. OF I. URBANA-CHAMPAIGN

DETERMINATION OF ALUMINUM UNDER PAPERMAKING CONDITIONS,
Papiripari Vallalat Kutato- es Fejlesztointezete, Budapest (Hungary).
J. Papp.
Svensk Papperstidning, Vol. 79, No. 9, p 286-291, May 30, 1976. 11 fig, 23 ref.

Descriptors: *Pulp and paper industry, *Aluminum, *Water analysis, Potentiometers, Electrochemistry, Electrodes, Fluorides, Ions, Wastes, Industrial wastes, Water pollution sources, Trace elements, Effluents, *Pollutant identification.
Identifiers: *White water(Paper machines), Aluminum sulfate, Rosin size.

A fluoride-selective electrode method for the direct potentiometric analysis of aluminum in paper mill effluents is described. It is simple and rapid and suited for the analysis of alum-containing white waters, provided all solids have been filtered off. In its present form, the method cannot be used to determine total aluminum introduced into systems containing pulp plus rosin size, since part of the aluminum in the pulp and in precipitates is not accessible to reaction with fluoride ions. (Brown-IPC)

DETERMINATION OF LIGNIN IN EFFLUENTS (OPREDELENIE LIGNINA V STOCHNYKH VODAKH),
Vsesoyuznyi Nauchnyi Planovii Otdel Bumazhnoi Promyshlennost, Moscow (USSR).
A. A. Sokolova, D. P. Moseeva, and L. A. Semakova.
Bumazhnaya Promyshlennost, No. 2, p 23-24, February, 1976. 2 tab.

Descriptors: *Lignins, *Pulp wastes, *Spectrophotometry, Analytical techniques, Water pollution sources, Ultraviolet radiation, Chemical precipitation, Filtration, Drying, Separation techniques, Effluents, Wastes, Industrial wastes, *Pollutant identification.
Identifiers: *Black liquors, Rosin acids, Wood extractives.

The presence of extractives (mainly rosin acids) in kraft black liquor introduces a considerable error into the determination of lignin by ultraviolet absorption spectrophotometry (at 280 nm), because the extractives absorb at the same frequency. The lignin content determined may be as much as 25% higher than the actual content. A modified formula is presented for calculating the lignin content from spectrophotometric data which takes into account the concentration and the specific absorption of the extractives. The concentration of the extractives is determined in a black liquor sample by precipitating lignin with HCl, separating it by filtration, drying, and extracting with petroleum ether in a Soxhlet apparatus. The solvent is evaporated, the residue dried and weighed and the concentration of extractives calculated. The specific absorption of the extractives is determined spectrophotometrically in ethanol solution. (Stapinski-IPC)

PHOTOMETRIC METHOD FOR THE CONTROL OF SUSPENDED SOLIDS IN SEDIMENTATION TANKS (FOTOMETRICHESKII METOD KONTROLYA VZVESHENNYKH VESHCHESTV V OTSTOINIKAKH),
Vsesoyuznyi Nauchnyi Planovyi Otdel Bumazhnoi Promyshlennost, Moscow (USSR).
S. S. Simonov, Yu. D. Miromanov, and I. A. Evstigneev.
Bumazhnaya Promyshlennost, No. 2, p 24, February, 1976. 1 fig.

Descriptors: *Suspended solids, *Pulp wastes, Instrumentation, Settling basins, *Photometry, Equipment, Water pollution sources, Foreign countries, Pulp and paper industry, Monitoring, Effluents, *Settling tanks, Sedimentation
Identifiers: USSR, Clarifiers, Savealls, Process control

The apparatus described, which was developed at the All Union Research Institute of the Pulp and Paper Industry (USSR), allows not only controlling the operation of a sedimentation tank by sample analysis, but also obtaining full information on the distribution of suspended solids directly in the operating tank within a short time (1.5-2 hr). In the apparatus (a diagram of which is given), a resistance box is included in the circuit of a photoresistor, and the reduction in voltage is measured by a recording potentiometer. The photoelectric sensor, which is immersed in the liquid, consists of a turbidity meter and an automatic indicator of the sediment level. The photometric method of determining the distribution of suspended solids can also be used in clarifiers with a suspended sediment layer, in savealls, etc. (Stapinski-IPC)

SIMPLIFIED KJELDAHL NITROGEN DETERMINATION FOR SEAWATER BY A SEMIAUTOMATED PERSULFATE DIGESTION METHOD,
Suffolk County Dept. of Environmental Control, Hauppauge, N.Y.
J. M. Adamski.
Analytical Chemistry, Vol. 48, No. 8, p 1194-1197, July, 1976. 2 fig, 7 ref, 5 tab.

Descriptors: *Nitrogen, *Sea water, *Water analysis, Analytical techniques, Trace elements, Water chemistry, Colorimetry, Chemical analysis, Phenols, Ammonia, Pollutant identification.
Identifiers: *Kjeldahl nitrogen, Potassium persulfate.

Persulfate digestion in combination with indophenol colorimetry via a Technicon AutoAnalyzer II was used as an alternative to the standard Kjeldahl nitrogen method as specified in 'Standard Methods for the Examination of Water and Wastewater' (American Public Health Association). Application of this method to the analysis of seawater samples demonstrated that a large quantity of samples can be rapidly processed with relative ease in a small environmental laboratory. A detection limit of 0.06 mg/liter as nitrogen was calculated for the operating range 0-5.6 mg/liter. Seawater samples spiked with 3.00 mg/liter of ammonia nitrogen were analyzed with a precision of 0.25 mg/liter and a spike recovery of 105+6.8%. Seawater samples spiked with 3.35 mg/liter of Kjeldahl nitrogen contained in a raw domestic waste were analyzed with a precision of +0.30 mg/liter and a spike recovery of 100+8.1%. The persulfate method simplifies the determination of Kjeldahl nitrogen in seawater while successfully maintaining low level requirements for sensitivity, precision, and accuracy. (Witt-IPC)

MICROGRAM DETERMINATION OF BORON IN SURFACE WATERS BY ATOMIC EMISSION SPECTROMETRY,
Utah State Div. of Health, Salt Lake City. Bureau of Labs.
F. D. Pierce, and H. R. Brown.
Analytical Chemistry, Vol. 48, No. 4, p 670-673, April, 1976. 2 fig, 8 ref, 3 tab.

Descriptors: *Water analysis, *Boron, *Surface waters, *Spectroscopy, Analytical techniques, Water pollution sources, Trace elements, Water chemistry, Water properties, Water quality, *Pollutant identification, *Spectrophotometry
Identifiers: *Atomic emission spectrometry

A description is given of an automated method for the analysis of boron in surface water specimens by atomic emission spectrometry. The technique employs a nonmechanical concentration step, an automated boron concentration by methanol distillation, and an automated aspiration-analysis procedure. Sixty specimens can be distilled and 180 distilled specimens can be analyzed per hour. The detection limit and the sensitivity provided by the technique are 0.002 mg/liter and 0.004 mg/liter, respectuvekt. (Witt-IPC)

ANALYSIS OF SELECTED BENTHIC COMMUNITIES IN THE FLORIDA EVERGLADES WITH REFERENCE TO THEIR PHYSICAL AND CHEMICAL ENVIRONMENT,
Geological Survey, Tallahassee, Fla.
B. G. Waller.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-25593, $4.00 in paper copy, $3.00 in microfiche. Water-Resources Investigations 76-28, April 1976. 33 p, 6 fig, 7 tab, 21 ref.

Descriptors: *Water quality, *Marshes, *Canals, *Florida, *Benthos, Invertebrates, Water analysis, Environmental effects, Flow rates, Discharge(Water), Agricultural runoff, Sewage effluents, Data collections, Water pollution sources.
Identifiers: *Everglades(Fla).

pecies diversity and numbers of benthic macroin-ertebrates were determined at 12 sites, both anals and marshes, in the Everglades of south lorida. The values calculated are used to indicate ng-term trends in water quality and variations etween study areas. Species diversity at all sites as generally in a range indicative of degraded ater quality. The number of organisms per quare meter of bottom surface was highly varia-le ranging from 43 to 8,200 organisms. Chemical nalysis of water and bottom material indicated no ross contamination from sewage or agricultural noff in any of the canals where benthic organ-ms were collected. Other physical factors such s depth, velocity of flow, substrate type, and ater-level fluctuation were responsible for the w species diversities and variable numbers of or-anisms, rather than contamination from urban or gricultural areas. dentifiers: NASQAN.

he U. S. Geological Survey (USGS) has tablished the National Stream Quality Account-g Network (NASQAN) to make continuous mea-rements needed to assess national and regional ater quality. NASQAN, which is based on a drologic subdivision of the United States, esently includes 345 stations, and is designed to clude 525 stations when completed. Data are col-cted on a wide-range of physical, chemical, and ological characteristics. Samples are processed rough the USGS Central Laboratory System, a oup of large laboratories which have been tablished to take advantage of efficient and sen-ive, but expensive instruments. NASQAN will ovide an assessment of water quality on national d regional scales, but a host of other programs e needed to provide all the information required manage water quality. (Woodard-USGS)

PARTICULATE RESIDENCE TIMES,
Atmospheric Environment Service, Toronto (Ontario).
D. M. Whelpdale.
Water Air Soil Pollut. 3(3), p 293-300, 1974.

Descriptors: *Air pollution, *Canada, *Great Lakes, Lakes, Mathematical models, Pollutant identification, Path of pollutants, Water pollution.
Identifiers: *Lake St. Clair, *Air particulate deposition(Lakes).

Examination of suspended particulate concentration data from a 1 yr-long, regional air-quality study of a portion of the Great Lakes (Canada) area revealed that depletion of particulates occurred during extended periods of travel over water surfaces. Based on particulate concentrations and meteorological measurements, residence times of background regional particulate matter were between 5-16 h in the region. Using a simple model for the deposition of particulate matter into the lakes, deposition rates ranging from 0.2-3.9 micro-g m-2 s-1 were found. This results in an estimated 150 metric tons of material being deposited into Lake St. Clair, area 1270 km2, during a 24 h period.--Copyright 1975, Biological Abstracts, Inc.

WATER QUALITY OF STREAMFLOW FROM PONDEROSA PINE FOREST WATERSHEDS ON SEDIMENTARY SOILS,
Arizona Univ., Tucson. School of Renewable Natural Resources.
P. F. Ffolliott.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-256 760 $3.50 in paper copy, $3.00 in microfiche. Completion Report, August 1976. 4 p, 1 tab, 2 ref. OWRT A-066-ARIZ(2), 14-34-0001-6003.

Descriptors: *Water quality, Watershed management, Land use, Water analysis, *Ponderosa Pine tree, *Arizona, *Pollutant identification, *Forest watershed, Correlation analysis, Salts, Surface runoff, Streamflow, Water sampling.
Identifiers: *Sedimentary soils.

Water samples were collected weekly and at times of unusual hydrological events from 4 ponderosa pine watersheds on sedimentary soil to; (1) examine the chemical, physical, and bacteriological characteristics (2) explore the empirical association of these water quality parameters with land use patterns, and (3) analyze the interactions among these parameters. In each sample, calcium, magnesium, and sodium were measured using atomic absorption spectrophotometry; carbonate and bicarbonate were measured by titrating with standard acid; and fluoride, sulfate, nitrate, phosphate (in a limited number of samples), and chloride amounts were determined by colorimetric methods using an Autoanalyzer. Hydrogen ion concentrations were measured using a glass electrode; suspended sediment concentrations were determined by filtration; and the presence of fecal coliform was determined using the membrane filter technique. Statistical analyses indicated no significant difference between water quality parameters among the four watersheds. Correlation analysis revealed that pH was inversely related to sodium, chloride, nitrate, and bicarbonate, and positively associated with calcium. Streamflow discharge was positively related to fluoride and nitrate, and negatively correlated to sodium and total soluble salts. While conductivity and total soluble salts were positively associated, no associations existed between concentrations of individual chemical constituents and suspended sediment, nor between concentrations of suspended sediment and streamflow discharge. No fecal coliform was found in the samples tested. (Hasbrouck-Arizona)

NON-POINT SOURCE WATER QUALITY MONITORING, INYO NATIONAL FOREST, 1975,
California University, Los Angeles, Environmental Science and Engineering.
Available from the National Technical Information Service Springfield, Va. 22161 as PB-256 713 $5.50 in paper copy, $3.00 in microfiche. Progress Report, Contribution No. 156 California Water Resources Center, Davis, March 1976. 138 p, 67 fig, append. Edited by J. Baas, F. D. Westerdahl, and R. L. Perrine. (California Water Resources Center Project UCAL-WRC-W-489).

Descriptors: *Water quality, *Monitoring, Environmental effect, *Recreation wastes, National parks, *California, Water pollution sources, *Sampling, Tests, Testing procedures, *Pollutant identification.
Identifiers: *Inyo National Forest(Calif).

Results are presented of a study on the impact of non-point sources on water quality in wilderness and recreational areas within the Inyo National Forest. One objective was to assess water quality with regard to physical, chemical and bacteriological parameters in a manner evaluation of area-wide sources. A second objective was to develop improved test methods for continuing water quality monitoring and protection in such areas. A monitoring program was conducted, in which 34 sites, selected by the U. S. Forest Service, were sampled one or more times during the summer and fall of 1975. Most sites can be characterized as high altitude, alpine lakes of small to moderate size or streams, snow-fed from granite basins. All sites represent areas frequented by recreational visitors, and were sampled with their use as a primary concern. Physical measurements included air and water temperature, dissolved oxygen, pH and total dissolved solids. Chemical analyses included tests for sulfates, nitrate-nitrogen, Kjeldahl nitrogen, chloride, phosphates, total phosphorus and methylene blue active substances. Bacteriological observations included total and fecal coliform organism and Yersinia enterocolitica. Additional sampling concerned algae in a portion of the lakes studied. A separate research effort by means of laboratory-scale experimental investigation looked into the means of transport of bacteria from sites at which they might be deposited to a nearby water body. Descriptors: *Pollutant identification, *Herbicides, *Pesticide residues, *Solvent extractions, *Chromatography, Water analysis, Soils, Sugar beets, Distillation.
Identifiers: Chloroform extraction, *Lenacil, Thin layer chromatography.

The chemically pure herbicide, lenacil, is a colorless, odorless crystalline powder containing 80% of the active principle 3-cyclohexyl-5,6-trimethylene uracil. The method developed for determining residues of lenacil in water, soil and sugar beets is based on extraction of the herbicide from the investigated sample with chloroform, distillation of the solvent and TLC. The sensitivity of the method is 5-10 micro g of lenacil in the sample.--Copyright 1975, Biological Abstracts, Inc.

THE STATISTICAL APPROACH TO THE STUDY OF THE SMALL RIVERS HYDROCHEMICAL REGIME IN WESTERN POLESYE OF THE UKRAINIAN SSR, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hydrobiologii.
I. V. Grib, and B. I. Nabivanets.
Gidrobiol Zh. 10(2), p 11-21, 1974.

Descriptors: *Statistical studies, Rivers, Water chemistry, Estimating, Dissolved oxygen, Biochemical oxygen demand, *Carbonates, *Calcium, *Chlorides, Ions, *Mineralogy, *Pollutant identification.
Identifiers: Polesye, *Ukrainian-SSR, USSR.

A statistical analysis was performed for long-term data on the hydrochemical regime of small rivers in western Polesye of the Ukraine (USSR). The processing involved the following hydrochemical estimates: BPK5 (biochemical O2 demand for 5 days), dissolved O2, permanganate oxidability NH3-N, chlorides, Ca, Mg, hydrocarbonates and mineralization. Equations showing the relation of these estimates to water out-flow rates were formulated and respective correlation coefficients calculated. The natural background is assumed as a basis for deducing mineralization equations expressed through the HCO3-, Ca2+ and Cl- contents.--Copyright 1975, Biological Abstracts, Inc.

QUANTITATIVE CHARACTERISTICS OF DISTRIBUTION OF BDELLOVIBRIO BACTERIOVORUS IN RIVER WATER, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Inst. of Biochemistry and Physiology of Microorganisms.
V. A. Lambina, N. A. Chuvil'skaya, L. A. Ledova, A. V. Afonigenova, and I. V. Averburg.
Mikrobiologiya. 43(4), p 715-720, 1974.

Descriptors: *Bacteria, *Viruses, Distribution, Pollutant identification, E coli, Bioindicators, Microorganisms, Rivers, Parasites, Water pollution, Water purification, Self purification.
Identifiers: *Bdellovibrio-Bacteriovorus, *USSR(Okra River).

Quantitative characteristics of the distribution of B. bacteriovorus were studied in the water of the Okra river (USSR), namely, the ratio between this bacterial parasite and the total content of microorganisms in the water as well as the concentration of Escherichia coli, one of its most widely distributed hosts. The distribution of Bdellovibrio can be a criterion for water contamination. Bdellovibrio is probably one of the active factors participating in water self-purification.--Copyright 1975, Biological Abstracts, Inc.

THE DETERMINATION OF PHENOLS IN WATER: GAS CHROMATOGRAPHIC IDENTIFICATION BY MEANS OF THE ELECTRON AFFINITY, (IN GERMAN),
Mainz Univ. (West Germany). Hygiene Institut.
H. Kunte.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. 160(2), p 148-154, 1975.

Descriptors: *Pollutant identification, *Phenols, *Gas chromatography, Organic compounds, Analytical techniques.
Identifiers: *Electron affinity(Phenols), Electron capture detector, Flame ionization detector.

The electron affinities for 98 phenolic compounds were determined using an electron capture detector (ECD) and a flame ionization detector (FID). The signals of the 2 detectors were registered simultaneously on a 2 channel recorder by splitting the gas stream at the column outlet for the ECD and the FID (1 1). The peak areas were corrected for equal concentration and instrument parameters and the ratio of peak area (ECD) to peak area (FID) was used as a measure of electron affinity. Among the phenolics found in water there are several groups with high or very high electron affinity, e g , dichlorophenols, trichlorophenols, tetra- and pentachlorophenol; the values of these compounds are about 100, 1000, 10000, and 30000 times higher, respectively, than that of phenol itself and its alkyl derivatives. For the mono- and dinitrophenols the corresponding figures are between 100 (o-nitrophenol) and 5000 (dinitrophenols). A comparatively high value was found for salicyclic aldehyde: about 250 compared with phenol. The application of these values in the identification of some peaks in the gas chromatogram of a river water extract is demonstrated.--Copyright 1975, Biological Abstracts, Inc.

STUDY OF THE BEHAVIOUR OF POLIOMYELITIS VIRUS TYPE 1 IN DIFFERENT HYDROUS MEDIA, (IN FRENCH),
Metz Univ. (France).
J. Schwartzbrod, P. Dixneuf, L. Schwartzbrod, J. C. Brochet, and J. M. Foliguet.
Rev Epidemiol Med Soc Sante Publique 23(4/5), p 235-252, 1975.

Descriptors: *Bacteria, *Viruses, *Humus, Water pollution, Water analysis, Organic matter, Statistical studies, Volumetric analysis, Pollutant identification.
Identifiers: Pecornavirus, *Poliovirus, Hydrous media.

Several surveys on natural inactivation of viruses in water were analyzed. The survival life of poliomyelitis virus type 1 was studied in hydrous medium of known composition, well-buffered and devoid of any bacterial contamination, in a similar medium with organic humate-type substances added. The experiment was done at 4C and at room temperature (18-24C). The presence of humate-type substances apparently has no significant influence on the development of poliomyelitis virus type 1. The survival time of the virus in the experiment was an average of 296 days for a storage temperature of 18-24C (much longer than previously described). It was longer in water kept at 4C. Statistical calculations and titrations performed for 550 days indicated that the total disappearance of the virus occurs only after 10-15 yr.--Copyright 1976, Biological Abstracts, Inc.

THE APPLICATION OF 'BIOTIC INDICES' TO THE STUDY OF POLLUTION IN A RIVER WITH CYPRINIDAE, (IN FRENCH),
Station Bioligique des Eyzies (France).
G. Moreau, J. Couffignal, J.-P. Dubreuil, J.-M. Fauconnier, and J. Lancon.
Ann Limnol. 8(1): 71-85. Illus. 1972. (Engl. Ger. summ.).

Descriptors: *Bioindicators, *Benthos, *Invertebrates, *Hydrobiology, Bioassay, Chemical analysis, Pulp wastes, Water pollution, Rivers.
Identifiers: *Cyprinidae, *France(Vezere River).

A hydrobiological profile of the Vezere (France) was drawn up for the lower reaches, from below Terrasson to below Bugue, by calculating 'biotic indices' based on variations in the populations of benthic invertebrates. The results produced evidence for an important disturbance of the fauna within 2 sectors: the 1st sector was a 25 km stretch immediately downstream from a paper-pulp factory; the 2nd section of about 7 km was situated downstream from the 1st zone and its origin, in the absence of all apparent sources of pollution, was hypothetically attributed to a resurgence of water disappearing just downstream from the factory. Physical-chemical analyses were in agreement with these results and indicated that the pollution is of an organic nature. The advantages of the 2 methods, chemical and biological, as well as a proposal for the improvement of the biotic-index method, were discussed.--Copyright 1975, Biological Abstracts, Inc.

Available from the National Technical Information Service, Springfield, Va 22161, as PB-241 641, $7.75 in paper copy, $3.00 in microfiche. Report EPA-560/3-75-002, April, 1975. 172 p, 2 fig, 11 tab, 208 ref, 4 append.

Descriptors: *Waste water treatment, *Pollutant identification, *Biochemical oxygen demand, *Organic compounds, *Water supply, Chemical wastes, Chemical industry, Chemistry, Industrial wastes.

An initial assessment is provided of the possible sources of 154 organic compounds which have been identified in drinking water supplies. Of these, 113 are classified as major pollutants. The most obvious industrial source of organics is the point source discharge of effluents, both treated and untreated. Chlorinating such effluents controls biochemical oxygen demand (BOD) but can create highly unreactive substances. In municipal systems, discharged compounds may become halogenated, be partially or completely degraded, or remain unchanged. Organics emitted as air pollutants may enter surface waters by rainfall. Organic compounds from landfilled solid wastes, sludges, and slurries may leach into groundwater where they may be degraded or interact to produce other organic compounds. Discharges from domestic treatment plants may also be responsible for a variety of chlorinated organics. Chlorination of river water containing organics can produce several halomethanes and haloethanes. Industrial product use, however, appears to be the greatest potential source of organic pollutants, because recovery of product is maximized during manufacture. Sixty-seven of the compounds considered may be formed by various chemical reactions in air, water, or soil. Of the 154 compounds studied, 7 were classified as easily degraded, 17 as degraded without much difficulty, 41 as difficult to degrade, 36 as very difficult to degrade, and 53 as refractory. This distribution is as expected, because less persistant chemicals should be expected to degrade closer to their sources before being detected. (Snyder-FIRL)

Descriptors: *Quality control, *Water quality, *Analytical techniques, *Evaluation, *Pollutant identification, Measurement, Data processing, *Methodology.
Identifiers: Pyridine-barbituric acid method, Cyanide, Environmental Protection Agency.

The procedure for validating the Environmental Protection Agency's water and waste water data is described. Formal collaborative studies are conducted among federal, state, industrial, laboratories. Samples are prepared in pairs as similar but different concentrates in sealed glass ampuls, and aliquots are added to distilled and natural waste water for subsequent determination by participating laboratories. Differences in the recoveries in these water samples indicate method bias and interferences. Computer programs are used to statistically treat the data and complete the evaluations. The results from these measurements are used to characterize specific analytical methods, to establish precision and accuracy limits for Environmental Protection Agency manuals, and to provide input to formal reports developed by the Agency. Examples of data summaries are provided for the Pyridine-Barbituric Acid Method for total cyanide and cyanide amenable to chlorination in natural waters. (See also W76-10637) (Kreager-FIRL)

THE MICROBIAL DEGRADATION OF OIL IN THE SEA,
University Coll., Cardiff (Wales). Dept. of Microbiology.
D. E. Hughes, and P. McKenzie.
Proceedings of the Royal Society of London, Biological Sciences, Vol 189, No 1096, p 275-483, 20 May 1975. 9 fig, 1 tab, 39 ref.

Descriptors: *Continental shelf, *Oil spills, *Oil pollution, *Microbial degradation, *Fossil fuels, Resources development, Environmental effects, Water pollution effects, Water resources, Seepage, Nutrients, Alkanes, Aliphatics, Aromatic compounds.
Identifiers: *Outer Continental Shelf, Offshore technology, Crude oils, Environmental impact.

Oil in the sea, whether from natural seepage or spillage undergoes weathering and loses its lighter fractions so that it sinks: emulsification can also take place. Action to remove spillage includes the use of sinking agents or emulsifiers. From the moment oil is released, microbial infection takes place. This leads to further chemical and physical changes in the oil. Depending on the presence of nutrients (nitrogen, phosphate, oxygen) and other factors such as temperature, oil droplet size etc., microbial growth and consequent oil degradation proceeds. In laboratory experiments and some field studies about 40-90% of the oil may degrade. Alkanes and other saturated compounds are the first to be degraded, aromatic and heterocyclic compounds are the first to be degraded, aromatic and heterocyclic compounds follow; no complete stoichiometric account has yet been made. Sinking agents and dispersants may affect the rate and pattern of degradation. (Sinha-OEIS)

TOXIC HEAVY METALS IN GROUND WATER OF A PORTION OF THE FRONT RANGE MINERAL BELT,
Colorado School of Mines Golden. Dept. of Chemistry; and Colorado School of Mines, Golden. Dept. of Geochemistry.
R. W. Klusman, and K. W. Edwards.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-256 212, $4.50 in paper copy, $3.00 in microfiche. Colorado Environmental Resources Center Fort Collins, June 1976. Completion Report Series No.72. 61 p, 6 fig, 23 tab, 54 ref, append. OWRT A-023-COLO(2).

Descriptors: Arsenic, Cadmium, Copper, Iron, Lead, Manganese, Mercury, Zinc, *Groundwater, *Heavy metals, Water pollution, Mining, Toxicity, Trace elements, *Colorado, *Mineralogy, Public health, Water analysis, *Pollutant identification, *Distribution patterns, Water quality standards.
Identifiers: Front Range mineral belt(Colo), Silver.

A study of toxic trace metal distribution in ground waters of the Front Range mineral belt, Colorado and adjacent areas was completed in order to determine the relationship of water quality to mineralization and the magnitude of potential health effects. Samples were collected and analyzed for arsenic, cadmium, copper, iron, lead, manganese, mercury, silver, znd zinc. Field determinations of pH, Eh, and specific conductance were also made. The samples were divided into two populations; those inside the mineral belt and those outside. Utilizing the observed data distributions, geochemical abundance estimates are made. The data distributions are normalized and corrected for analytical error and determinations below the detection limit, then expressed as a predicted central 95% range for each element in each population. The data are used to determine the probability of ground water exceeding the specified U.S. Public Health Service limit for each constituent.

CHLORIDE MANAGEMENT IN LAKE ERIE BASIN,
State Univ of New York at Buffalo. Dept of Civil Engineering
D. D. Meredith, and R. R. Rumer, Jr.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB 256 241 $4.50 in paper copy, $3.00 in microfiche. Water Resources and Environmental Engineering Research Report No. 76-2, June 1976. 65 p, 17 fig, 8 tab, 57 ref. OWRT B-044-NY(3), 14-31-0001-5059.

Descriptors: *Lake Erie, *Chlorides, *Mathematical models, *Simulation analysis, Management, New York, *Deicers, Urban runoff, Salts, Model studies, Lakes, Water pollution sources, Path of pollutants.
Identifiers: Buffalo(NY), *Deicing salts.

The deicing salt runoff from Buffalo, New York and selected nearby communities has been measured and it was found that, in the case of Buffalo, approximately 90% of the deicing salt applied is recovered by the combined sewer system. The Lake Erie drainage basin was subdivided into regions and a search of the literature was made to establish the historical data for chloride discharge from each region. Time-dependent equations were estimated for the annual chloride discharge from each source region and used in conjunction with a mathematical model for chloride balance in Lake Erie. It was possible to fairly reproduce the historical trend of chloride build-up in Lake Erie by this method. The calibrated model projects a chloride concentration in Lake Erie of 137 ppm by the year 2050. The effects of selected salt management programs on future chloride levels in Lake Erie are examined utilizing the model. A simulation model for evaluating effects of deicing salt is developed and applied to a case study of Buffalo, New York. The model simulates the melting of snow due to deicing salt and computes economic costs and benefits. It is shown that the amount of deicing salt used is greater than can be justified economically using the model. The model should be used for helping highway maintenance directors determine an upper limit to the amount of salt that should be used.

MECHANISMS OF LEACHATE FORMATION IN SANITARY LANDFILLS,
University of Southern California, Los Angeles. Environmental Engineering Program.
K. Y. Chen, and F. R. Bowerman.
In: Recycling and Disposal of Solid Wastes, Edited by T. F. Yen Ann Arbor Science Publishers, Inc., Ann Arbor, Michigan, 1974. p. 349-367, 4 fig., 2 tab., 8 ref.

Descriptors: *Landfills, *Solid wastes, Aerobic conditions, Anaerobic conditions, Water pollution sources, *Leachate, Path of pollutants, *Decomposing organic matter, Percolation, Groundwater.
Identifiers: *Anaerobic decomposition.

The percolation of water through a landfill results in a solution with high concentrations of both organic and inorganic compounds, which is generally referred to as leachate. Refuse placed in a sanitary landfill undergoes biological, physical and chemical changes which results in decomposition of the refuse, production of leachate, and production of various gases. Leachate formation is affected by the types of waste material placed in the landfill; the temperature; pH and moisture placed in the landfill; the quality of external sources of water; and the composition of cover soil. Initial decomposition of refuse takes place aerobically. When all the oxygen available is consumed, anaerobic decomposition takes place. After leachate formation, the leachate will migrate in the direction of ground water flow with an additional vertical gradient. Ground water will dilute the leachate to some extent. (Grass-IsWWA)

FEM COUPLED WITH LP FOR WATER POLLUTION CONTROL,
Hiroshima Inst of Tech., Hatsukaichi (Japan).
T. Tatsumi, S. Tamai, and M. Yamazaki.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 102, No. HY7, Proceeding paper No. 12244, p 881-897, July 1976. 8 fig, 2 tab, 43 equ, 11 ref.

Descriptors: *Water pollution control, *Finite element analysis, *Linear programming, *Water quality, *Water resources, Assessment, Diffusion, Environmental effects, Planning, Mathematical models, Equations, Systems analysis, Optimization, Discharge(Water).
Identifiers: Double Fourier series.

The finite element (FE) and linear programming (LP) method has been developed in order to solve systems of differential equations with equality or inequality constraints and an objective function. The applicability of the FE and LP method is shown through numerical examples of water pollution problems governed by the convective diffusion equation. The method makes it possible to obtain the optimal discharges from the various types of outfall to meet water quality requirements, and also the distribution patterns of several water qualities in the water basin simultaneously. A new criterion for selecting the locations of outfalls and the optimal volumes of discharged wastewater may be given by the method. In order to check the results of the FE and LP method, an analytical method by the double Fourier series is developed and described briefly. (Bell-Cornell)

ESTIMATING FLOW CONDITIONS FOR RIVER MODELS,
Utah Water Research Lab., Logan.
W. J. Grenney, and D. S. Bowles
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE4, Proceedings paper No. 12297, p 693-707, August 1976. 12 fig, 1 tab, 6 equ, 1 ref.

Descriptors: *Water pollution control, *River flow, *Streamflow, *Water quality, *Water resources, *Management, River basins, Water allocation(Policy), Irrigation water, Computer models, Systems analysis.
Identifiers: Boundary conditions, Mass balances.

River water quality models are important management tools for assessing the impact of point and diffuse pollution loads on the chemical and biological characteristics of the water at various points in a river network. In a river basin, the magnitude of the flow at any point and time is a dominant characteristic affecting pollutant concentration. Flows from headwaters, surface and subsurface lateral inflow, point loads, and diversions, as input as boundary conditions to water quality models so that the flow at any location on the river network can be computed. This paper describes a 'man-in-the-loop' computer model developed to utilize available historical streamflow data and user judgement to estimate flow boundary conditions for a water quality model. Applications of the model include the efficient allocation of irrigation water, and performing mass balances on any conservative substance, such as salinity. The model has been applied to the Weber River basin, located northeast of Salt Lake City, Utah. (Bell-Cornell)

RESPONSE OF SOUTH PLATTE TO EFFLUENT LIMITATIONS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.

D. W. Hendricks, and M. H. Bluestein.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE4, p 745-768, Proceedings paper No. 12294, August 1976. 11 fig, 7 tab, 7 ref.

Descriptors: *Water quality, *Colorado, *Simulation analysis, *Computer models, *Sewage effluents, Limiting factors, Environmental engineering, Sanitary engineering, River systems, Systems analysis.
Identifiers: *South Platte river systems(Colo), *Federal laws, Systems engineering.

The South Platte river system is typical of many stream systems in the arid west. A computer simulation model has been used to project the water quality improvements resulting from implementation of 1977, 1983, and 1985 effluent quality limitation requirements of PL 92-500 for all waste discharges in the basin. Implementation of Pl 92-500 will result in continued good quality of waters in the mountains zone. The results of the simulation show that sufficient improvements of water quality in the plains zone will be achieved by 1983 to permit fish propagation and recreation. However, improvement in water quality along in the plains zone will result in few benefits at very high cost. Their achievement is essentially precluded by the modifications brought about by intense human uses of the stream and associated lands and by the limiting natural characteristics of the plains system. PHENOXY HERBICIDE RESIDUES AND THEIR PERSISTENCE,
Midwest Research Inst., Kansas City, Mo.
W. B. House, L. H. Goodman, H. M. Gadberry, and K. W. Dockter.
In: Aquatic Plant Control Program: Integrated Control of Alligator Weed and Water Hyacinth in Texas, Army Engineer Waterways Experiment Station, Vicksburg, Miss., Technical Report No. 1, March 1975, p. G3-G15. 50 ref.

Descriptors: *Herbicides, *Pesticide residues, Persistence, Agronomic crops, Pastures, Vegetation, Public health, Wildlife, Leaching, Aquatic life, Soil types, Weed control, Paraquat, Diquat, Resistance, Water pollution, 2,4-D, 2,4,5-T, Potable water, Degradation(Decomposition).
Identifiers: Phenoxyacetic acids, Silvex, Amitrole.

Crops grown in rotation and subsequent natural vegetation may be injured by residues remaining after herbicide treatment. Human health may also be threatened by accumulations of herbicide residues in plants which are then consumed by animals, birds, and fish. Leaching of herbicides to rivers, lakes and reservoirs can affect aquatic life and water quality. The persistance and residues of herbicides are reviewed. Many factors are involved in herbicide persistance in soils, but temperature, moisture, and soil type are especially important. Preplanting, pre-emergence, and post-emergence applications of herbicide to croplands can be made. Selection of the herbicide depends on weed specificity, speed of herbicide dissipation, and residue carry-over when crops are rotated. Weather conditions also affect the speed of dissipation. Tolerance of the primary and succeeding crops for the herbicide must also be considered. A serious problem involving the effect of herbicide residues and their persistence in the ecosystem involves the possible contamination of water supplies used for human consumption. Watersheds and drainage from cropped areas might cause secondary effects involving the health of domestic animals, wildlife, or aquatic life. Many of the studies described here have been concerned with phenoxyacetic acids and their esters, paraquat, diquat, silvex, and amitrole. (See also W76-11145) (Buchanan-Davidson--Wisconsin)

EFFECT OF TILLAGE SYSTEMS ON RUNOFF LOSSES OF PESTICIDES: A SIMULATED RAINFALL STUDY,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
J. L. Baker, H. P. Johnson, and J. M. Laflen.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 514, $5.50 in paper copy, $3.00 in microfiche. Completion Report, Iowa State Water Resources Research Institute, Ames, No. ISWRRI-71, June 1976. 98 p. 16 fig., 6 tab., 52 ref., append. OWRT B-050-1A(1) 14-31-0001-5073.

Descriptors: *Cultivation, *Simulated rainfall, *Pesticide residues, Adsorption, Herbicides, Insecticides, Sediments, Water yield, *Nutrient removal, Iowa, Soils, *Path of pollutants, Water loss, *Pesticide drift, Water pollution sources.
Identifiers: Lasso, Bladex, Dyfonate, Alachlor, Cyanazine, Fonofos, *Iowa Corn Belt.

Pesticide losses were measured from small plots subjected to simulated rainfall. The plots are established at three locations in Iowa, each with different soils and slopes. The plots were tilled parallel to the slope by six different tillage practices. One insecticide (fonofos) and two herbicides (alachlor and cyanazine) were applied to the soil at recommended rates shortly before simulating two rains at 6.35 cm/hr and a third at 12.7 cm/hr (totalling 21.6 cm). Concentrations of all three pesticides in both sediment and water sample decreased significantly with time. Pesticide concentrations in water were correlated with percent residue cover. Fonofos concentration in water were so low (avg. 0.014 ppm) that even though much more water than sediment was lost a major carrier was sediment (avg. of 1.8% of the fonofos applied was lost). The ratio of herbicide concentration sediment to that in water (ranged from 5 to 10) was less than the ratio of water to sediment lost; thus, water was the major carrier of the two herbicides. Decreases in herbicide losses from decreased runoff and erosion from plots with conservation tillage practices are negated by higher herbicide concentrations. For alachlor the average loss from all plots was 7.9% of that applied (8.0% for conventionally tilled plots); whereas, the average for cyanazine was 11.0% (9.7% for conventionally tilled plots). Sediment and water loss data as well as nutrient loss data for a companion study are given.

ECOLOGY OF THE LITTORAL POLYCHAETE STREPTOSYLLIS WEBSTERI, A NEW SPECIES IN THE BALTIC,
Morski Instytut Rybacki, Gdynia (Poland).
L. Zmudzinski.
OIKOS Supplementum 15, p. 133-134, 1973. 2 fig., 2 ref.

Descriptors: *Benthic fauna, Aquatic animals, *Benthos, Habitats, *Littoral, *Niches, Aquatic life, Salinity, Temperature, *Ecology, *Pollutant identification, Water pollution sources, *Path of pollutants.
Identifiers: *Baltic Sea, Species identification, *Polychaetes, *Streptosyllis websteri.

The polychaete Streotosyllis websteri has been discovered in the southern Baltic and is new to the Baltic. It is an eurythermic (0-18C), polyoxybionthic (4.8-7.8 ml 02/1 in the bottom water) and euryhaline species (from at least 7.5 to 15.0 0/00) and occurs in a narrow band along the Baltic south coast and on some adjacent banks on sandy and gravel grounds, mainly at depths of 10 to 30 m. It probably occurred earlier in western parts of the Baltic, but its presence there was overlooked. It is possible that it occurs along the western and eastern coasts of the central Baltic. (Katz)

PHOSPHORUS MOBILITY IN LAKE ONTARIO SEDIMENTS,
Wisconsin Univ., Madison. Water Chemistry Lab.
R. T. Bannerman, D. E. Armstrong, G. C. Holdren, and R. F. Harris.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 158-178, 1974. 4 fig, 13 tab, 33 ref. EPA R-800609, USDA 12-14-3001-226.

Descriptors: *Phosphorus, *Lake sediments, *Lake Ontario, Inorganic compounds, Phosphorus compounds, Sediments, Sorption, Chemistry, Analytical techniques, Cores, Core drilling, Sampling, Surveys, Lakes, Limnology.
Identifiers: *International Field Year for the Great Lakes, Inorganic phosphorus.

Sediment cores were obtained from 15 lake stations representing the three major basins and the inshore zone of Lake Ontario. Cores were sectioned for characterization of the surface sediments according to inorganic P chemical mobility. Physical mobility was characterized by measurement of P release from intact cores incubated under controlled laboratory conditions. The proportions of potentially chemically mobile inorganic P were usually high (30 to 60%) in the central basin sediments and low (2 to 8%) for the inshore zone sediments. Although the amounts of inorganic P desorbed after three successive equilibrations of Lake Ontario sediments represented only 3 to 17% of the potentially mobile inorganic P, sufficient inorganic P was desorbed to restore a large part of the original interstitial inorganic P concentrations. Interstitial inorganic P (mobile P) concentrations ranged from 14 to 1280 micrograms/liter and were higher than dissolved inorganic P concentrations in the overlying water. Diffusion rates estimated from the range of observed interstitial inorganic P values ranged from about 0.05 to 0.6 mg/sq m/day and were in agreement with the range of 0.03 to 0.8 mg/sq m day estimated from P release rates from intact cores incubated under controlled laboratory conditions. Based on an inorganic P flux of 0.2 mg/sq m/day, the estimated annual contribution of inorganic P to Lake Ontario water is equal to about 10% of the external P loading. STUDIES OF PLUTONIUM CYCLING AND SEDIMENTATION IN LAKE MICHIGAN,
Argonne National Lab., Ill. Radiological and Environmental Research Div.
M. A. Wahlgren, and D. M. Nelson.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1, McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 212-218, 1974. 3 fig, 1 tab, 20 ref.

Descriptors: *Radioisotopes, *Sediments, *Plankton, *Lake Michigan, Zooplankton, Phytoplankton, Turnovers, Mixing, Lakes, Sampling, Surveys, Suspended solids, Lake sediments, Detritus, Path of pollutants, Radioactive wastes, Sedimentation, Cesium
Identifiers: *Plutonium.

Estimates of cumulative deposition, together with the results of extensive lakewide sampling in 1972, yielded estimates of mean halftimes for removal from the water column of Lake Michigan of 1.0 + or - 0.3 yr for Pu239,240, and 1.4 + or - 0.3 yr for Cs137. However, data from 1971, 1972 and 1973 water samples indicate that the recent half-time is much greater than the 1963 1972 average, presently being on the order of 3 to 4 yrs for both Pu239 and Cs137. The longer turnover time is consistent with the Cs137 turnover time in the water column deduced from analysis of preserved Lake Michigan alewives. Water filtration experiments have demonstrated that greater than 75% of the plutonium is nonfilterable and is present as colloid or sub-colloidal sized fractions. At an offshore station near Grand Haven, Michigan, the concentration of Cs137 in the epilimnion underwent a slight but significant decline from June to November, whereas Pu239 was reduced to a small fraction of its spring value. In net plankton samples dominated by phytoplankton a much lower mean Cs137:Pu239 ratio is observed than in water samples, indicating a preferential sorption of Pu239 over Cs137 by phytoplankton. The results of these experiments suggested that sorption by phytoplankton (and the subsequent rapid settling from the epilimnion of phytodetritus and/or zooplankton fecal pellets) is responsible for the rapid removal of Pu239 from the epilimnion. OCCURRENCE OF AS, CD, CO, CR, CU, FE, HG, NI, SB, AND ZN IN LAKE ERIE SEDIMENTS,
Bowling Green State Univ., Ohio. Dept. of Geology.
L. J. Walters, Jr., T. J. Wolery, and R. D. Myser.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 219-234, 1974. 5 fig, 4 tab, 40 ref. OWRT A-032-OHIO(3).

Descriptors: *Heavy metals, *Sediments, *Lake Erie, *Great Lakes, Pollutants, Water pollution, Industrial wastes, Metals, Lake sediments, Cores, Sampling, Harbors, Lakes, Sedimentation.
Identifiers: Heavy metal enrichment.

Ten trace and minor elements (Fe, Cr, Co, Cd, Zn, Ni, Sb, As, Hg, and Cu) were determined in sediment cores from eight stations in Lake Erie. The cores were representative of sediments in the western, central, and eastern basins of the lake and included one core each from the harbors of Cleveland and Buffalo. The results generally showed significant enrichments witin the upper thirty cm of bottom sediment for all metals except iron and cobalt. Each harbor core contained high enrichments of most heavy metals but reflected an individual pollution history. Lower magnitudes of enrichment were found in the open lake cores, which generally decreased going from the western basin toward the eastern basin. The order of enrichment by metal was (from least to greatest): Fe, Co, Ni, As, Cr, Zn, Cu, Sb, Cd, Hg. Mercury dating shows that the heavy metal inputs apparently underwent major increases in the period 1948-1955. Intermittent pollution inputs cause irregular concentration-depth profiles which are probably altered to a minor extent by upward transport of metal in the sediment column via a reaction-diffusion mechanism. In 48% of the cases the top interval of the sediment column showed a decrease in heavy metal content. The order of surface enrichment for the metals correlated with the order of ionization potentials, electron affinities, and electronegativities, and suggested that some chemical process is active in controlling the distribution and concentration of the heavy metals. W76-11293

POLLUTANT MERCURY AND SEDIMENTATION IN THE WESTERN BASIN OF LAKE ERIE,
Bowling Green State Univ., Ohio. Dept. of Geology.
T. J. Wolery, and L. J. Walters, Jr.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1, McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 235-249, 1974. 5 fig, 2 tab, 41 ref. OWRT A-032-OHIO(4).

Descriptors: *Mercury, *Sediments, *Lake Erie, Sedimentation, Industrial wastes, Sedimentation rates, Pollutants, Water pollution, Water pollution sources, Sampling, Surveys, Cores, Model studies, Mathematical models, Sludge worms, Benthic fauna, Biochemistry.

Mercury concentrations in the sediments of the western basin of Lake Erie generally decrease with depth to a background level. The point at which the background value is reached in a sediment column represents the time (1939) of the first of two major increases in the rate of pollutant-mercury input to the western basin. A second increase in the rate of input correlates with a major plant expansion in the local chlor-alkali industry in 1954. These points of sudden increase of mercury concentration in the mercury-depth profiles have been used to obtain modern sedimentation rates for the bottom sediments of the western basin at a total of 64 stations. The method relies on the extremely high enrichment of mercury over background levels, good historical documentation of industrial inputs, fast dispersal of these inputs over the basin, and the lack of sufficient post-depositional alteration of the mercury depth profile in the study area. Confirmation of the method was found by: (1) internal consistency with respect to the two episodes of increase in input of mercury, (2) good correlation with a less precise chromium method, and (3) correlation with pollen-dated cores. Estimated rates of sedimentation ranged from 0.06 to 1.5 cm/yr in areas of active sedimentation, with a mean rate over these areas of 0.44 cm/yr. A model was proposed in which clean sediment is deposited over a homogeneous mercury reservoir, which loses mercury to the overlying water mass according to first-order kinetics until a critical depth is reached. numerical model for the time-dependent, three- nensional, variable-density flow from a horizon- rectangular discharge into a basin has been veloped. Steady-state results were presented for resentative flow conditions of the Cuyahoga er entering Lake Erie and of the Point Beach wer Plant thermal discharge into Lake chigan. Results for three different cases of the yahoga River were given. Two cases were for ted discharge at different flow rates entering a stant depth basin. The lower rate corresponded lows typical of the late summer months and the her flow rate corresponded to flows typical of spring. The third case was for the low flow rate ted discharge entering a variable-depth basin. e depth variation was such that the basin depth bled in two and one-half river widths and then ained constant. This depth variation was not listic for the Cuyahoga River, but it was used to icate the importance of the variable-depth in. For the Point Beach thermal discharge cal- ation, the vertical eddy coefficient was as- ed to be a function of the local vertical tem- ature gradient and the actual bottom topog- hy was used. DELING CHLORIDE DISTRIBUTION IN GINAW BAY,
vironmental Protection Agency, Gross Ile, h. Gross Ile Lab.
L. Richardson.
Proceedings, Seventeenth Conference on at Lakes Research, Part 1; McMaster Univer- , Hamilton (Ontario), August 12-14, 1974. In- ational Association for Great Lakes Research, 2-470, 1974. 6 fig, 4 tab, 10 ref.

Descriptors: *Model studies, *Chlorides, *Bays, *Lake Huron, Watersheds(Basins), Mathematical models, Circulation, Water circulation, Water quality, Water pollution, Pollutants, Runoff, Water chemistry, *Path of pollutants.
Identifiers: *Saginaw Bay(Mich).

A steady-state, finite difference model has been structured for Saginaw Bay to analyze average circulation patterns by tracing chlorides through the system. Model inputs include chloride loads from tributaries, segment volumes, segment interface areas and boundary conditions at Lake Huron. The model also requires advection and dispersion transport between adjacent segments which are the 'unknowns'. Model output is the average chloride concentration in each model segment. Initial assumptions of average flow (advection) were made. Although circulation is highly dependent on wind conditions and change rapidly, the type of model employed uses average circulation and considers the highly transient phenomena as part of the dispersion transport. Sensitivity analyses were performed by varying flow and dispersion until a reasonable fit was obtained with the observed chloride concentrations. (See also W76-11275) (Sims-ISWS)

Identifiers: *Fox River(Wis), Effluent limits.

A mathematical model describing the interrelationship between the dissolved oxygen concentration of a river and its various sources and sinks has been adapted for use in a study of the Lower Fox River in Wisconsin. The analysis assumes steady-state conditions and described the longitudinal distribution of dissolved oxygen in the river from Neenah-Menasha to Green Bay, a distance of approximately 64.4 km. The sources of dissolved oxygen included in the model are atmospheric reaeration, algal photosynthetic activity, and reaeration over dams. The sinks of dissolved oxygen considered are carbonaceous biochemical oxygen demand, nitrogenous biochemical oxygen demand, sludge oxygen demand, and algal respiration. The model was verified for various conditions of waste loading, river temperature and river flow. The model then was used to evaluate the effect on water quality of implementing interim best practicable control technology effluent limitations for industrial discharges and 90% biochemical oxygen demand removal limitations for municipal sources. The study indicated that implementation of the above effluent limits will result in a significant improvement in water quality in the Lower Fox River. A daily average dissolved oxygen concentration of 4 to 5 mg/l will be maintained under low-flow, summer conditions and will not fall below 4 mg/l more than about 2% of the time during extreme low-flow and high temperature situations. A SIMULATION MODEL FOR PHOSPHORUS WASTE DISCHARGES IN THE LAKE ERIE BASIN,
Case Western Reserve Univ., Cleveland, Ohio. Dept. of Chemical Engineering.
R. Prober, and P. B. Melnyk.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 514-519, 1974. 4 fig, 1 tab, 5 ref.

Descriptors: *Phosphorus, *Model studies, *Waste disposal, *Lake Erie, Mathematical models, Forecasting, Watersheds(Basins), Water treatment, Waste water treatment, Pollutants, Water pollution, Phosphorus compounds, Nutrients, Nutrient removal, Detergents, Water pollution sources, Chemical wastes, Lakes.

An aggregated simulation model was presented for pollutant generation and wastewater treatment in the Lake Erie watershed. Based on total capacities for treatment, the model calculated daily average discharges into receiving waters as well as total capital and operating costs for treatment. This is done separately for the five watershed sub-basins. Calculated results were presented for planning scenarios for phosphorus control which consist of schedules for: (1) fraction of wastewaters treated, (2) fraction of treated wastewater receiving secondary or advanced treatment, (3) phosphorus content of advanced treatment effluents, and (4) detergent phosphorus usage per capita. One scenario approximates present planning for implementation of advanced treatment and upgrading of conventional facilities. By the mid-1980's, this is predicted to reduce discharges by 30% for solid phosphorus and by 70% for dissolved phosphorus. However, population and economic growth at historic levels would negate these improvements, increasing discharges back almost to 1970 levels by 2020 despite continuing new plant construction and more severe advanced treatment. For comparison, another scenario considers elimination of detergent phosphorus. This, along with planned expansions of conventional treatment, would achieve reductions of phosphorus discharges quite similar to the present planning, but without the costs for advanced treatment. Identifiers: *Buffalo(NY), Chloride balance, Chloride control.

LIBRARY U. OF I. URBANA-CHAMPAIGN

The de-icing salt runoff from Buffalo, New York, and selected nearby communities has been measured. It was found that, in the case of Buffalo, approximately 90% of the de-icing salt applied is recovered by the combined sewer system. The Lake Erie drainage basin was subdivided into regions and a search of the literature was made to establish the historical data for chloride discharge from each region. Time-dependent equations were estimated for the annual chloride discharge from each source region and used in conjunction with a mathematical model for chloride balance in Lake Erie. It was possible to fairly reproduce the historical trend of chloride build-up in Lake Erie by this method. The calibrated model projects a chloride concentration in Lake Erie of 135 ppm by the year 2050. The effects of a few selected salt management programs on future chloride levels in Lake Erie were examined utilizing the model. (See also W76-11275) (Sims - ISWS)

THE EFFECT OF A FOSSIL FUEL POWER PLANT'S COOLING WATER SYSTEM ON THE WATER QUALITY OF GREEN BAY, WISCONSIN,
Wisconsin Univ., Green Bay. Coll. of Environmental Sciences.
J. H. Wiersma, I. K. Iskandar, L. J. Schwartz, R. W. Lanz, and C. C. Weber.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton(Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 535-543, 1974. 2 fig, 4 tab, 18 ref.

Descriptors: *Cooling water, *Powerplants, *Water quality, *Wisconsin, *Lake Michigan, Surveys, Sampling, Bays, Rivers, Temperature, Water temperature, Water cooling, Chemicals, Nutrients, Bacteria, Dissolved oxygen, Trace elements, Water pollution, Water pollution sources, Pollutants.
Identifiers: *Green Bay(Wis), *Fox River(Wis).

During 1973, water samples were collected in duplicate from two separate intakes and the outfall of a 439 megawatt (e) coal-fired power plant located at the confluence of the Fox River and lower Green Bay arm of Lake Michigan. Condenser cooling water for the plant is obtained from both the Fox River and lower Green Bay. Temperature and dissolved oxygen were monitored continuously in the two intakes and outfall. Twenty-two physical-chemical water quality parameters were measured monthly. Bacterial studies were conducted concurrently with the water chemistry studies. Trace elements were determined quarterly. Primary productivity studies were also conducted during summer months in the vicinity of the power plant. Minimum temperature differences between the intakes and the outfall occurred during the critical summer months and maximum temperature changes during the very cold months of the year. No significant losses of dissolved oxygen were found in the condenser discharge water but super-saturation occurred during the spring, primarily in April. The intake waters were generally high in nutrients (especially phosphorus) and turbidity. For most parameters the composition of the outfall water did not vary significantly from that of the intakes. However, sporadic significant changes were detected in ortho-phosphorus, total phosphorus, nitrite, turbidity, conductivity, ammonia, total silica, and iron. Bacterial populations in the intake and discharge waters of the electric generating plant varied widely. The heated discharge water alone had little or no effect on either the bacterial populations or primary productivity. (See also W76-11275) (Sims - ISWS)

A SIMULATION MODEL FOR LONG-TERM FORECASTING OF WASTE LOADINGS FROM POPULATION, LAND USE, AND ECONOMIC ACTIVITIES IN THE GREAT LAKES BASIN,
Canada Centre for Inland Waters, Burlington (Ontario).
D. E. Coleman, J. P. H. Batteke, and S. Madras.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 544-548, 1974. 5 fig, 4 ref

Descriptors: *Model studies, *Forecasting, *Water quality, *Economics, *Great Lakes, Mathematical models, Land use, Population, Economic prediction, Economic impact, Waste disposal, Social aspects, Social impact, Lakes, Pollutants, Technology, Social values, Simulation analysis, Computer models

The water quality of the Great Lakes is a time-lagged reflection of human and other natural activities in the basin. Whereas levels of waste loadings and economic activities are well correlated, changes in people's attitudes towards water quality will, in the long run, affect the nature of this correlation in many different ways. Traditionally, one forecasting technique has employed statistical methods based on extrapolation of curves fitted to historical data and multiple regressive techniques for estimating equations. Such an approach could be called naive for longterm forecasting purposes because it does not handle adequately the causal relationships and interactions among the numerous economic, social and technical parameters. If the nature of the causal mechanism changes, forecasting errors will result. However, changes in the causal relationships are the essence of the long-term forecasting problem. The alternative approach to forecasting, the use of a dynamic simulation model, provides much more flexibility in that it allows incorporation of gradual changes in social and economic 'constraints'. Also, this methodology permits the introduction of descriptive knowledge, in addition to numerical knowledge. The emphasis is on explaining interactions by means of feedback loops in quantitative terms, rather than on providing rigidly qualified statistical results. The simulation model provides a reliable extension to intuitive reasoning. (See also W76-11275) (Sims - ISWS)

AN ECONOMETRIC FORECASTING MODEL FOR THE MAJOR METROPOLITAN AREAS IN THE LAKE ERIE BASIN,
Case Western Reserve Univ., Cleveland, Ohio. Dept. of Economics.
M. D. McCarthy, and C. Loxley.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 574-586, 1974. 6 tab, 3 ref.

Descriptors: *Model studies, *Econometrics, *Water pollution, *Lake Erie, Mathematical models, Simulation analysis, Forecasting, Population, Economics, Employment, Economic impact, Water quality, Phosphorus, Cities, Wages, Water pollution sources.
Identifiers: *Econometric forecasting models, *Cleveland(Ohio), Manufacturing.

An econometric model has been developed that can forecast and simulate long-run economic trends for the major standard metropolitan statistical areas (SMSAs) in the Lake Erie Basin. Its design is such that it can be made part of an intergrated modelling approach to phosphorus pollution in Lake Erie. The strategy adopted is to apply a dynamic aggregate general model to the major metropolitan area within each water-resource area. This approach is thus a relatively inexpensive way to deal with such a large area given the available data base. The analysis starts by presuming that aggregate U.S. economic trends are the principal determinant of manufacturing output and employment. The regional model is therefore linked to, and driven by, forecasts for the U. S. taken from an available national econometric model. Key variables, manufacturing employment and total population are determined from local behavioral relationships. The paper described the algebraic structure of an abstract general metropolitan model and presented details of its application to the Cleveland SMSA and the extrapolation of results to the Southern Lake Erie area. The estimates for each equation were presented along with graphs illustrating their performance, and the results of the complete model simulations were discussed. (See also W76-11275) (Sims - ISWS)

GROUND-WATER FLOW AND POLLUTION A A WELL FIELD, OLEAN, NEW YORK,
Geological Survey, Albany, N. Y.
A. D. Randall.
Open-file Report 76-397, June 1976. 21 p, 10 fig, tab, 6 ref.

Descriptors: *Water pollution source *Groundwater, *Water wells, *Path of pollutant *Groundwater movement, Aquifer characteristic Pumping, Drawdown, Water quality, Samplin Nitrogen compounds, *New York, Monitoring.
Identifiers: Olean(NY), Well field.

From September 1970 through October 1975, t U. S. Geological Survey investigated and mon tored ground-water pollution at a well field Olean, N. Y. Ground-water withdrawal at Nor Olean has created a cone of depression as deep 30 feet. Ground water near the well field has be polluted by petroleum, hexavalent chromium an most recently, nitrogen compounds. The appare source of the nitrogen compounds is near land su face in a small area nearly 2,000 feet southwest the center of the well field. From 1970 to 197 concentrations of ammonia plus nitrate have reg larly exceeded 2,000 mg/liter as nitrogen in wat from three test wells. All of the nitrogen-bearin water flows toward the center of the well field a is eventually withdrawn by wells. If all pumpi near North Olean were to cease, 4 to 8 mont might be required to fill the cone of depressio

hereafter the polluted water would move radually to the south or southwest at a rate of oughly 4,500 feet in 12 years. (Woodard-USGS)

MODEL FOR THE STUDY OF EPISODES IN IE DISPERSION OF A CONSERVATIVE POLTANT IN LAKE MICHIGAN,
nois Univ., at Chicago Circle, Chicago. Dept. of formation Engineering.
M. Schwab, and P. L. Katz.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, New York, p 837-845, 1974. 5 fig, 1 tab, 15 ref.

Descriptors: *Model studies, *Pollutants, *Dispersion, *Lake Michigan, Water pollution, Lakes, Nutrients, Circulation, Water circulation, Mixing, Winds, Simulation analysis, Mathematical models, Water quality, *Path of pollutants, Thermal stratification, Limnology.
Identifiers: *Pollutant dispersion.

Simulation of a conservative pollutant's two dimensional dispersion in vertically stratified (summer) Lake Michigan, using circulation patterns from an existing model, makes possible the study of short term pollution episodes. Discharges may be traced from one or more sources, for a variety of sequences of wind forcing. The finite difference scheme strictly conserves pollutant mass, even if the underlying circulation patterns contain possible inconsistencies. Dispersion of a hypothetical conservative pollutant for an actual 125 day period was simulated using U. S. Weather Service wind histories and using USEPA 'STORET' chloride discharge data for 28 sources to represent typical discharge levels. In addition, 'best' and 'worst' cases were demonstrated, for 33 day episodes following the assumed discharge of a single 'slug' of pollutant into Calumet Harbor, using two actual 33 day wind histories from 1970-71. Wind and resulting circulation histories have a marked effect on pollutant dispersion. Under (worst case) variable wind conditions, even a single 'slug' discharge can result in several weeks of concentration buildup in adjacent nearshore regions. Under (best case) constant winds, the flushing action of coastal jets prevents such a buildup. This has implications in terms of water quality standards for pollutant discharges into large lakes. Identifiers: Lateral-longitudinal dispersion.

An experiment and a numerical scheme which combine previously given methods for the dispersion and seepage phenomena were presented to describe the dispersion of a pollutant in porous media beneath a triangular channel. The combined effect of longitudinal and lateral dispersion was considered. Numerical concentration profiles are given along with a comparison of experimental and numerical data. The technique suggested can be extended to other channel shapes and flow fields accounting for the capillary fringe.--Copyright 1974, Biological Abstracts, Inc.

FALLOUT 137CS IN THE SOILS AND SEDIMENTS OF THREE SMALL WATERSHEDS,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
J. C. Ritchie, J. R. McHenry, and A. C. Gill.
Ecology. 55(4), p 887-890, 1974.

Descriptors: *Radioisotopes, *Mississippi, *Watersheds(Basins), Distribution patterns, Path of pollutants, Grasses, Crops, Forests, Erosion, Soils, *Sediments.
Identifiers: *Cesium-137.

A budget for the distribution of fallout 137Cs was calculated for 3 small watersheds in northern Mississippi. The cover in 1 contributing watershed is predominantly forest, in the 2nd it is predominantly grass, and in the 3rd predominantly grass and crops. Of the total 137Cs input, 97%, 88% and 85% remained in the forest, the grass and the grass-crop watersheds. The concentration of 137Cs per unit area in the reservoir sediments was 2.8, 3.8 and 4.0 times that of the soils from the respective contributing watersheds, indicating that the reservoirs are acting as 'traps' for 137Cs. Of the 137Cs eroded from the 3 contributing watersheds, 57%, 38% and 25% was found in the respective sediments. The calculated loss of 137Cs per unit area was: eroded soils > croplands > grass > forest.--Copyright 1975, Biological Abstracts, Inc.

DOCUMENTATION FOR ES001. A STEADY-STATE, ONE DIMENSIONAL, ESTUARINE WATER QUALITY MODEL,
Environmental Protection Agency, New York. Region II.
S. C. Chapra, and S. Gordimer.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-246 847, $7.75 in paper copy, $3.00 in microfiche. Environmental Protection Agency Final Report No. ES001, September 1973. 224 p, 11 ref, append.

Descriptors: *Computer programs, *Estuaries, *Water quality, *Biochemical oxygen demand, *Dissolved oxygen, Mathematical models, Water resources, Resource development, Model studies.

ES001 is a computer program which can be used to simulate tidally averaged one dimensional steady-state estuarine systems and predict water mathematical model of an estuarine system. The basic approach used in ES001 is the law of conservation of mass. The model presented is specifically applied to the BOD-DO deficit system, however analogous systems of sequential reactions of two substances, or single systems under first order kinetics may also be modelled. ES001 is presently programmed for use on the IBM 370 while ES002 is compatible with an IBM 1130 system. ES001 is capable of modelling general one-dimensional estuarine systems for a variety of substance concentrations. The program requires segmentation of the system being modelled into sections within which the various geomorphological, physical and hydrological parameters of the estuary are constant. The sections are then connected mathematically, the junction points of these segments being boundary points where these parameters can change. Several types of junctions are allowed including triple junctions, dams, etc., which in combination allow the modelling of numerous types of configurations. The model is assumed to be at steady state and to be tidally averaged. Steady state means that the variables and parameters describing a system do not vary with time. Finally, reaction kinetics are assumed to be of the first-order for the reasons that many substances reacting in an estuary approximate this type of behavior. (Sinha - OEIS)

Identifiers: *Outer Continental Shelf, Oil slicks.

When oil is spilled at sea, a portion of it evaporates. The amount depends upon the oil's physical properties and environmental conditions. This paper explores the effect of a random environment on the evaporation process. A random model is developed to predict the residual volume of oil as a function of elapsed time, initial oil volume and its physical properties, and random environmental factors (wind speed and ambient temperature). A simple example illustrates application of the model. Also, a simulation illustrates the effects of random wind speeds on the residual volume and area of the oil slick as a function of time. MODELING THE FATES OF METALS IN OCEAN-DISCHARGED WASTEWATERS,
Southern California Coastal Water Research Project, El Segundo.
T. J. Hendricks, and D. R. Young.
Southern California Coastal Water Research Project Report No. TM 208, Jan 1974. 32 p, 12 fig, 4 tab, 7 ref.

Descriptors: *Continental shelf, *California, *Waste disposal, *Metals, *Water pollution sources, *Waste water(Pollution), Coasts, Sediments, Water resources, Model studies, *Path of pollutants.
Identifiers: Outer Continental Shelf, *Ocean dumping.

Numerical models of the deposition of wastewater particulates and the mobilization of trace metals associated with the particulates were used to examine the fates of five metals (copper, zonc, chromium, lead, and cadmium) present in the submarine wastewater discharges of the Los Angeles County Sanitation Districts. The models predicted that the effluent-related deposition rates will exceed natural sedimentation rates for distances of up to 8 km from the outfalls and account for more than 80 percent of the variation in the metal concentrations observed in the sediments of this area. A discontinuity in the sediment metal distributions at about 3 km from the outfall was revealed by the models; this discontinuity was interpreted as the boundary between aerobic and anaerobic sediments and the position of a corresponding change in the metal mobilization rates. These predictions were compatible with earlier measurements of the physical, chemical, and biological characteristics of the sediments. The models also predicted that, although 90 percent of the metals discharged through the outfall system are associated with particulates, only 10 percent of the metals in the effluent would be retained in the nearby sediments. This prediction agreed with a budget estimated using a different technique. Most of the sewered wastewaters from the coastal regions of southern California are eventually discharged into the ocean. The major discharges, totaling approximately 1 billion gallons per day undergo a minimum of primary treatment prior to their introduction into the ocean through submerged outfalls terminating at a depth of about 200 feet. A STUDY OF THE QUALITY OF SILK REELING WATER IN REGARD TO SOLUBILITY OF COCOON-SERICIN, (IN JAPANESE),
Ministry of Agriculture and Forestry, Tokyo (Japan). Sericultural Experiment Station.
S. Bito.
Bull Seric Exp Stn (Tokyo). 25(6), p 371-583, 1973

Descriptors: *Water quality, *Cation exchange, Conductivity, River, Water wells, *Alkalinity, Hardness(Water), Industrial wastes, *Correlation analysis, Coagulation, *Regression analysis, Salts, Mixing, *Solubility.
Identifiers: Cocoon-sericin, Conductivity, *Japan, *Silk reeling water, Aluminum salts.

The silk reeling region in Japan was divided into 8 zones, the quality of the reeling water of mills, including the river and well water of the environment, was chemically investigated. The quality of water in the 8 zones was compared. Some characteristics of the river and well water (including alkalinity, electro conductivity and hardness) are enumerated. The solubility of cocoon-sericin was investigated in all reeling waters and abnormal quality zones identified. Correlation in factors of water quality was analyzed for rivers and wells in all zones. Correlation between the solubility of cocoon-sericin and other factors of water quality are drawn, and coefficients of correlation presented. Multiple regression analysis was attempted on the relation between the solubility of the cocoon-sericin and factors of water quality; alkalinity is the main contributing factor for the sericin solubility. Regression equations were set up to estimate sericin solubility with respect to alkalinity. Improvements on abnormal water vis-a-vis solubility of cocoon-sericin were examined; good results have been obtained toward regulation of solubility of the rough cation-exchange, coagulation by aluminum salts, and mixing with water of different alkalinity.--Copyright 1975, Biological Abstracts, Inc.

Pochvoved Nauki (Mosc) 18(1), p 114-118, 1975.

Descriptors: *Water quality, *Irrigation water, Drain, Irrigation systems, Evaporation, Sodium, Drainage, Potassium, Chlorides, Ions, Groundwater, Sulfates.
Identifiers: *USSR(Don River).

Drain, irrigation, drainage and ground waters and their evaporites of the Bagaevsk-Sadkovsk irrigation system supplied from the Tsymlyansk reservoir on the Don River in the Russian SFSR (USSR) were studied. As the water flows from the reservoir to the drainage outlet its composition changes considerably. The concentration of Na, Mg, Cl and sulfate ions changes as a result of evaporation and Ca and Mg ions as a result of interaction with the solid phase of the soils.--Copyright 1976, Biological Abstracts, Inc.

Descriptors: *Diptera, Distribution, Effluents, Lakes, Streams, Biochemical oxygen demand, Nitrates, Ammonia, Oxygen, Water pollution effects, Bioindicators, Larvae.
Identifiers: Anopheles-Claviger, Arrone Stream(Italy), Bracciano, Culex-Pipiens, Culicidae, Orthocladinae, Pupae, Simuliidae, Simulium-Galeratum, Tanipidynae, Wilhelmia-Aureum, Wilhelmia-Latipes, Wilhelmia-Ornata, Italy(Bracciano Lake).

Collecting places (12) in effluents of Bracciano Lake and height collecting places in Arrone Stream (Italy) were examined for aquatic dipterous larvae, during 4 summer months. Various chemical and physical examinations were performed. The distribution in the 20 collecting places of larvae and pupae of Chironomidae (Chironominae, Tanipodynae, Orthocladinae), Culicidae (Culex pipiens, Anopheles claviger), Simuliidae (Wilhelmia latipes-group W. aureum-group, W. ornata-group, and Simulium galeratum) is reported. The summer values of biological oxygen demand (BOD5) saturated O2, NH3 and NO3 are presented. Aquatic larval Diptera, especially Simuliidae, Chironomidae and Culicidae, may be used as ecological indicators.--Copyright 1976, Biological Abstracts, Inc.

THE DISTRIBUTION OF NUTRIENT SALTS IN THE MORLAIX BAY (FINISTERE, FRANCE): THE ROLE OF BENTHIC ALGAE, (IN FRENCH),
Brussels Univ. (Belgium). Lab. of Oceanography.
G. T. Houvenaghel.
Hydrobiologia 47(1), p 13-29, 1975.

Descriptors: *Algae, Bays, *Nutrients, *Salts, Benthos, Primary productivity, Salinity, Rivers, Silica, Dissolved solids, *Distribution, Path of pollutants.
Identifiers: *France(Morlaix Bay), English Channel.

A hydrologic profile of Morlaix Bay and River, carried out during the spring under favorable weather conditions, showed weak salinity gradients. The distribution of nutrient salts indicated the presence of 2 distinct zones: an estuarian zone, characterized by high production and large consumption of dissolved silica; and the bay zone, indicative of the activity of benthic macroscopic algae, which are responsible for 80% of the total consumption. Consumption levels suggested that water remained, at a minimum, 2 days in the estuary and 3 in the bay. Given the large volume of water required to maintain benthic and pelagic primary production, it is the English Channel that determines the biotic conditions of the bay.--Copyright 1976, Biological Abstracts, Inc.

LIPID COMPOSITION OF SURFACE FILMS, AND ZOOPLANKTON FROM THE EASTERN MEDITERRANEAN,
Institute of Oceanographic Sciences, Wormley (England).
R. J. Morris.
Marine Pollution Bulletin Vol. 5, No. 7, 1974. p. 105-109, 2 tab., 1 fig., 31 ref.

Descriptors: *Oily water, *Oil pollution, *Zooplankton, *Lipids, *Oil spills, Oil, Oil-water interfaces, Path of pollutants, Water analysis, Crustaceans, Fish, Surfaces, Films, Organic compounds.
Identifiers: *Mediterranean, *Petroleum hydrocarbons, *Tar balls, Tissue analysis, *Surface films, Biological concentration.

The natural surface films in the Eastern Mediterranean appear to be badly polluted with petroleum hydrocarbons, and sub-surface oil/water emulsions are also important contributors to the interface chemistry in certain areas. High levels of non-natural hydrocarbons are present in the lipids of some near-surface zooplankton from this region, suggesting that these animals store and concentrate the pollutant hydrocarbons. (Katz)

ORGANIC POLLUTION IN ENSENADA BAY, MEXICO,
Centre d' Oceanographie, Marseille (France). Station Marine d'Endoume.
M. L. Lizarraga-Partida.
Marine Pollution Bulletin Vol. 5, No. 7, 1974. p. 109-112. 2 tab., 2 fig., 6 ref.

Descriptors: Marine animals, *Benthos, *Organic wastes, *Annelids, *Domestic wastes, *Food processing industry, Organic loading, Industrial wastes, Molluscs, Gastropods, On-site investigations, Invertebrates, Bays, *Mexico, *California, Waste disposal, *Path of pollutants.
Identifiers: *Ensenada Bay(Mex), Baja(Calif), *Polychaetes.

Little attention has so far been paid to the effects of pollution on the Mexican coast. Pollution has become serious in a few industrial areas and attention is now being paid to the effect of discharging organic wastes into the sea at the important tourist center of Ensenada in Baja, California. As in other studies conducted at Los Angeles and Marseille, it has been found that the distribution of polychaete worms in the seabed is a valuable index of the state of health of the sea. (Katz)

PCB LEVELS IN CLYDE MARINE SEDIMENTS AND FAUNA,
Clyde River Purification Board, Glasgow (Scotland).
W. Halcrow, O. W. MacKay, and J. Bogan.
Marine Pollution Bulletin, Vol, 5, No. 9, 1974, p. 134-136, 2 tab., 3 fig., 11 ref.

Descriptors: *Polychlorinated biphenyls, *Sewage pollution, *Sediments, *Sluge disposal, *Sewage sluge, *Benthos, Water pollution effects, Bottom sediment, Benthic organisms, Pathology, Molluscs, Estuaries.
Identifiers: Sediment analysis, *Tissue analysis, *Chlorinated hydrocarbons, Buccinum, Nuccula, Chlamys, Glasgow, *Firth Clyde(Scotland).

Surveys in the dumping grounds for sewage from the City of Glasgow show accumulations of PCBs in superficial sediments, suggesting that significant quantities of these chlorinated hydrocarbons have been dumped for about 20 years with a marked increase about 10 years ago. The benthic fauna in the area is correspondingly contaminated. With restrictions on the manufacture of PCBs and the elimination of other sources in the catchment area, levels of contamination are expected to drop. (Katz)

MODELING SOLUTE TRANSPORT IN GROUND WATER,
Geological Survey, Denver, Colo.
L. F. Konikow.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 20-3-1 - 20-3-6. 7 fig, 18 ref.

Descriptors: *Model studies, *Groundwater, *Path of pollutants, *Solutes, *Industrial wastes, Flow, Ponds, Aquifers, Chlorides, Computer programs.
Identifiers: *Solute transport, Disposal ponds.

A computer model for simulating solute transport in flowing groundwater was developed by coupling a finite-difference solution to a groundwater flow equation with the solution to a solute-transport equation using the method of characteristics. The model accurately reproduced the observed 30-year history of contamination at the Rocky Mountain Arsenal in Colorado where liquid industrial wastes seeped out of unlined disposal ponds and spread for many square miles in an underlying alluvial aquifer. The model also integrated the effects of several factors that controlled changes in chloride concentrations. The model can thus predict the rates and directions of the spreading of conservative contaminants from known or projected sources when adequate hydrogeologic data are available. AN IMPROVED MODEL FOR ANALYSIS OF AIR AND WATER POLLUTION DATA,
Environmental Protection Agency, Las Vegas, Nev. Office of Research and Development.
D. T. Mage, and W. R. Ott.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 20-5-1 - 20-5-5. 5 fig, 2 tab, 13 ref.

Descriptors: *Model studies, *Water pollution, *Statistical models, *Mathematical models, *Diffusion, Ohio river, Rivers, Biochemical oxygen demand, Chemical oxygen demand, Coliforms, Chlorides, Sulfates, Analytical techniques.
Identifiers: Data analysis.

The role of univariate probability models in environmental data analysis is discussed, and an improved model for the analysis of air and water pollution data is presented. The improved model is based on a 3-parameter lognormal distribution and is proposed by considering diffusion processes, including sources and sinks, as stochastic phenomena. When the third parameter is negative, the model is censored at the third parameter; and when the third parameter is zero, a standard 2-parameter lognormal model results. The model was examined for 9 sets of water quality data obtained from the Ohio River including biochemical oxygen demand, chemical oxygen demand, coliforms, chloride, and sulfate. It showed considerable improvement over a standard 2-parameter lognormal distribution when parameters were estimated by the method of maximum likelihood. The model is recommended for general purpose analyses of environmental data. (See also W76-10637) (Kreager-FIRL)

FINE PARTICLES AND WATER QUALITY IN THE COASTAL MARINE ENVIRONMENT,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
J. R. Schubel.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 34-2-1 - 34-2-11. 5 fig, 3 tab, 48 ref.

Descriptors: *Suspended solids, *Estuaries, *Organic compounds, *Water pollution effects, *Coasts, Aquatic life, Dissolved oxygen, Nutrients, Geology.

The effect of man's activities on the particulate matter loading and water quality of coastal marine environments is discussed. Inputs of naturally occurring particulate matter to the coastal environment are being increased by land-use practices, dam and reservoir construction, river diversion, and projects to control shore erosion. Anthropogenic particulate matter input is also increasing as well as the local production of organic material as a result of nutrient loading. The increased influxes of particulate matter are significantly reducing the geological lifetimes of many coastal embayments, particularly estuaries. High concentrations of fine-grained suspended matter are degrading some coastal systems to the extent that their useful biological and recreational lifetimes may be cut drastically shorter than their geological lifetimes. Suspended particulate matter is capable of affecting the distribution of dissolved oxygen, decreasing the production of oxygen by rooted aquatic plants, acting as both a source and sink for nutrients, and concentrating various water pollutants. Representative concentrations of total suspended matter are tabulated for various estuarine environments. (See also W76-10637) (Kreager-FIRL)

UTILIZATION OF STREAM-BORNE PHOSPHORUS BY CAYUGA LAKE PHYTOPLANKTON,
Cornell Univ., Ithaca, N. Y.
J. P. Barlow.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-256 209, $3.50 in paper copy, $3.00 in microfiche. Completion Report, July 1976, 18 p, 5 fig., 1 tab., 9 ref. OWRT A-064-NY(1). 14-34-0001-6033.

Descriptors: *Phosphorus, *Eutrophication, Nutrients, Algae, Lakes, *Phytoplankton, *New York, Water pollution effects, Seasonal, Streams, Absorption.
Identifiers: *Cayuga Lake(NY), Desorption.

The objective has been to determine seasonal and within season variations in both amounts and biological availability of phosphorus (P) discharged by Salmon Creek, one of the major tributaries to Cayuga Lake. The stream P was partitioned into soluble and particulate forms by filtration, and, in addition, P was desorbed from particles by mixing stream water with low P lake water. Availability of these assays showed that desorbable P was most readily utilized, followed closely by soluble P in stream water, but that very little of the particulate P was useable. There appear to be seasonal variations in relative availability, as well as variations within single runoff events. Although these results are still preliminary, it is clear that, since most of the stream P is associated with particles, the availability of this P must be taken into account when estimates of P loading are made.

RELATIONSHIP BETWEEN WATER QUALITY AND PLANT GROWTH IN PONDS,
Rutgers, The State Univ., New Brunswick, N. J. Dept. of Soils and Crops.
D. N. Riemer, and B. J. Mottu.
Available from the National Technical Information Service, Springfield, Va 22161, as PB 256 513, $4.00 in paper copy, $3.00 in microfiche. New Jersey Water Resources Research Institute, New Brunswick. Completion Report, July 1976. 37 p, 15 fig, 11 tab, 1 ref. ONRI A-034-NJ(3), 14-31-0001-4030.

Descriptors: *Ponds, *Phytoplankton, *Water quality, *Carbon dioxide, *Nitrogen, *Phosphorus, Plants, Vegetation, Nutrients, Sediments, Anaerobic conditions, Oxygen, Eutrophication, Water pollution effects.

Phytoplankton growth, oxygen, nitrogen, phosphorus, carbon dioxide, and other parameters were measured in 12 ponds over a three year period. An unsuccessful attempt was made to increase the soluble phosphorus level of some of the ponds, apparently because the soluble phosphorus is an equilibrium value determined by conditions in the pond. Phytoplankton was generally at a maximum in late summer or early fall. Due to the occurrence of different vegetation types in different ponds, quantitative comparisons of growth among ponds could not be made. Maximum levels occurred during the winter and minimum levels occurred during the period of maximum phytoplankton growth. Soluble phosphorus was at a minimum during the winter and at a maximum during the summer. Carbon dioxide at the surface was depleted during periods of maximum phytoplankton growth but reached its maximum at the pond bottoms at the same time. The results indicate that nitrate, orthophosphate, and carbon dioxide levels fluctuate widely during the year and must be measured at specific times to obtain meaningful results. In the ponds studied, carbon dioxide production and release of phosphorus from insoluble forms appear to be the primary controlling factors in phytoplankton growth.

THE EFFECTS OF VARIATIONS IN TURBIDITY ON CYCLES OF PLANKTONIC AND BENTHIC ORGANISMS IN FLOOD CONTROL RESERVOIRS,
Mississippi Univ., Dept. of Biology.
Y. J. McGaha, J. W. Burris, and C. M. Cooper.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-256 55[illegible] $4.00 in paper copy, $3.00 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Completion Report, July 1976. 41 p, [illegible] tab, 28 ref, append. OWRT A-090-MISS(1).

Descriptors: *Turbidity, Biology, *Productivity, *Mississippi, *Plankton, Reservoirs, *Benthos, Flood control, Suspended solids, Water pollution effects, Cycles, Succession, *Grenada Reservoir(Miss).

The effects of turbidity on plankton and macrobenthos cycles in four northern Mississippi flood control reservoirs were studied. Turbidity measurements in part per million SiO2 were analyzed with other concomitant physiochemical data to ascertain the effects of suspended materials on planktonic and benthic cycles in the impoundments. A quantitative plankton analysis was made and 27 of the most abundant genera were entered in a computerized stepwise regression analysis against 20 predictor variables consisting of the physiochemical data. Significant correlation with respect to the turbidity variable was observed in 10 genera. A regression summary listing turbidity and other variables with significance above the .05 level is given for each of the 10 genera. Benthic organisms were analyzed separately and data were

ot computerized. An analysis of community egradation of benthos as a result of environmenl stress brought on by turbidity related henomena was undertaken. The main emphasis f the benthos study was in Grenada Reservoir, lississippi.

incident with an annual decrease in pH of orge Lake, at a rate of approximately 0.13 pH its per year, lake trout walleye, burbot, and all-mouth bass have disappeared. In 1973 rthern pike, rock bass, pumpkin-seed sunfish, own bullhead and white suckers did not roduce successfully. The size and population of ite suckers have decreased from 1967 to 1973 h a biomass in 1973 10 percent of that measured 1968. Spinal deformities first appeared in the ite sucker population in 1971 and increased to percent by the fall of 1972. This appears to be ated to a decrease in pH below 5.0. Abnormal ncentrations of calcium in the serum of white kers during the period of ovarian maturation s probably induced by low pH values and may related to the failure of fishes to spawn. (Katz)

criptors: *Rainbow trout, *Fishkill, ssolved oxygen, *Mortality, *Seasonal, iculture, *Eutrophication, *Temperature, dation, *Mortality, Commercial fish, *Fish ning, *Productivity, Environmental effects, ut, Salmonids, Lakes, Ammonia, Bioassay, oratory tests, Cyanophyta, Hydrogen ion conration, water pollution effects.
ntifiers: Sublethal effects.

seasonal mortality pattern and the causes of mortality of planted rainbow trout (Salmo dneri) were studied in eight small eutrophic s in central Canada used for extensive culture. Two periods of mortality were ald. The first occurred in all lakes during the 60 days of residence in the lakes and resulted e mortality of 60-90% of the numbers of fish ked. The second period occurred in about 20% e lakes and was due to low oxygen levels folng the collapse of a bloom of Aphanizomenon aquae. Rainbow trout are close to their iological upper tolerance levels in these lakes. r possible causes of mortality were synerc effects between algal toxins, ammonia and erature and bird predation. (Katz)

THERMAL TOLERANCE OF STORED FUNDULUS HETEROCLITUS GAMETES: FERTILIZABILITY AND SURVIVAL OF EMBRYOS,
Texas A and M Univ., College Station. Dept. of Biology.
K. P. Kuchnow, and R. S. Foster, IV.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 676-680, 1976. 2 fig., 3 tab., 22 ref.

Descriptors: Reproduction, Laboratory tests, *Temperature, *Mortality, *Fish reproduction, *Fish eggs, *Embryonic growth stage, Breeding, Fish, Teleosts, Aquiculture, Fish management, *Thermal stress, *Thermal pollution, Fertilization, *Gametocides, Water pollution effects.
Identifiers: Gametes, *Fundulus heteroclitus.

Fundulus heteroclitus ova were tested for fertility after storage intervals between 6 and 96 hr over a temperature range of 0-30 C. Sperm were tested after storage intervals of 2 to 24 hr over a temperature range of 0-20 C. Ova retained fertility best at 10-14 C with fertilization rates of 93, 80, and 46% after 24, 48 and 72 hr, respectively. Sperm retained fertility best at 0-4 C, with fertilization rate of 85, 59, and 25% after 2, 4, and 6 hr, respectively. Sperm retained fertility for a shorter time than ova because of sperm activity initiated by stripping. Variation in mortality in stored ova could be attributed to temperature differences. No relation between sperm storage temperatures and embryo mortality was found. (Katz)
W76-11180

PETROLEUM COMPOUNDS IN THE MARINE FOOD WEB: SHORT-TERM EXPERIMENTS ON THE FATE OF NAPHTHALENE IN CALANUS,
Marine Biological Association of the United Kingdom, Plymouth (England). Plymouth Lab.
E. D. S. Corner, R. P. Harris, C. C. Kilvington, and S. C. M. O'Hara.
Journal of the Marine Biological Association of the United Kingdom, Vol. 56, p. 121-133, 1976. 3 fig., 5 tab., 18 ref.

Descriptors: *Organic compounds, *Bioassay, *Absorption, *Path of pollutants, *Food webs, *Food chains, *Tracers, *Zooplankton, *Oil wastes, Metabolism, Methodology, Radioactivity, Laboratory tests, Crustaceans.
Identifiers: Naphthalene, Depuration, *Calanus sp., Bioaccumulation.

Adult female Calanus helgolandicus immersed for 24 hours in sea-water solutions of radioactively marked naphthalene accumulated a detectable quantity (3.6 pg/animal) from concentrations as low as 0.10 micrograms/1. Feeding experiments showed that the dietary route of entry was more important quantitatively than direct uptake from solution in that in order to ensure that the same quantity of radioactivity in the animals was attained by the two routes the level of hydrocarbon in solution had to be far greater than that present in particulate food. Depuration was much more rapid in organisms accumulating naphthalene from solution in sea water as compared to uptake through food sources. Only 5% of the original radioactivity remained after 10 days in the former case and about one third of the original radioactivity was detected after 10 days in the latter group. Short-term experiments determined that Calanus was able to metabolize naphthalene. (Katz)
W76-11181

UPTAKE PATHWAYS AND ELIMINATION OF A NONIONIC SURFACTANT IN COD (GADUS MORRHUA L.),
Kristinbergs Zoologiska Station (Sweden).
A. Granmo, and S. Kollberg.
Water Research, Vol. 10, p. 189-194, 1976. 4 fig., 2 tab., 23 ref.

Descriptors: *Absorption, *Surfactants, *Adsorption, *Mode of action, *Toxicity, *Temperature, *Oxygen, Laboratory tests, Water pollution effects, Methodology, Seasonal.
Identifiers: Gadus morhua, Tissue analysis, *Cod, Elimination, Bioaccumulation, Gills, Sub-lethal effects, Honylphonol cthoxylate.

The uptake and elimination of a labelled surfactant, the nonionic nonylphenol ethoxylate, was studied in cod (Gadus morrhua) exposed to a concentration of 5 ppm. The amount of labelled surfactant was analyzed by the scintillation counting method in various tissues from the fish. A penetration through the gills, and some intestinal resorption was found. Eight hours from start a steady state condition was obtained. High concentrations were found especially in gall bladder and liver. The elimination process in clean sea water was rapid and was evident after 24 hr. (Katz)
W76-11182

AN ASSESSMENT OF THE BASIS OF MERCURY TOLERANCE IN DUNALIELLA TERTIOLECTA,
Marine Biological Association of the United Kingdom, Plymouth (England). Plymouth Lab.
A. G. Davies.
Journal of the Marine Biological Association of the United Kingdom Vol. 56, p. 39-57, 1976. 6 fig., 3 tab., 38 ref.

Descriptors: *Toxicity, *Growth rates, *Bioassay, *Cytological studies, *Morphology, *Phytoplankton, Resistance, Laboratory tests, Heavy metals, Path of pollutants, Toxicants, Biochemistry, Metabolism, Amino acids, Potassium, *Mercury.
Identifiers: *Dunaliella sp., *Detoxication.

The specific growth rate of Dunaliella tertiolecta was unaffected by mercury II concentrations of at least 2.03 micrograms at/1 and a final level of cell material 13% below that of the control was obtained after exposure to 10 micrograms at/1. Growth was largely uncoupled from division and giant cells were produced, probably due to the effect of mercury upon the production of methionine which is associated with the process of cell division. Mercury tolerance was investigated in terms of (1) mercury detoxication in the culture medium by complex or compound formation between the metal and cellular metabolites, (2) the concentration of sulphydryl groups within the cell as sequestration sites, (3) the absence of cellular potassium leakage and (4) the resistance of the cell membrane to the uptake of mercury II ions. Results indicated that the mercury tolerance of D. tertiolecta is partly related to the slow rate of mercury accumulation by this species, but is largely due to the detoxification of the mercury within the cell, possibly by the precipitation of a highly insoluble mercury compound. (Katz)

CADMIUM UPTAKE BY MARINE FISH LARVAE,
Bundesforschungsanstalt fuer Fischerei, Hamburg (West Germany). Institut fuer Kuesten- und Binnenfischerei.
V. Dethlefsen, H. von Westernhagen, and A. Rosenthal.
Helgolander wissenschaftliche Meeresuntersuchungen, Vol. 27, p. 396-407, 1975. 6 fig., 30 ref.

Descriptors: *Larval growth stage, *Absorption, *Herrings, Marine fish, *Cadmium, Path of pollutants, *Metals, *Fish eggs, *Bioassay, Public Health, Laboratory tests, Fish, Heavy metals, Pathology, Analytical techniques, Spectrophotometry, Toxicants, Water pollution effects, Pollutant identification.
Identifiers: Bioaccumulation, *Platichthys sp., *Belone sp., *Flounder, Sublethal effects.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Eggs of herring (Clupea harengus), flounder (Platichthys flesus) and garpike (Belone belone) were incubated in cadmium contaminated water (0.05-5.0 ppm) and newly hatched larvae were analysed for cadmium contents. Cadmium residues in newly hatched larvae were dependent on cadmium concentrations during incubation. Newly hatched flounder and herring larvae contained two orders of magnitude more cadmium than Belone belone larvae (0.7-2.3 nannograms Cd/0.1 mg dry weight and 0.0017-0.0185 nannograms Cd/0.1 mg dry weight respectively). Cadmium content of herring and flounder larvae held in cadmium contaminated water increased with exposure time. Herring larvae accumulated more cadmium than flounder larvae held in the same conditions. (Katz)

THE BALTIC SEA POLLUTION,
Morski Instytut Rybacki, Gdynia (Poland).
L. Zmudzinski.
Polskie Archiwum Hydrobiologii, Vol. 22, No. 4, p. 601-614, 1975. 6 fig., 9 tab., 17 ref.

Descriptors: *Organic compounds, Water pollution effects, *Eutrophication, *Bioindicators, *Biodegradation, *Nutrients, *Primary productivity, On-site data collections, Water quality, *Phytoplankton, Benthos, *Biomass, Commercial fish, *Pesticide residues, Crustaceans, Invertebrates, Sediments, Phosphates, Reproduction, Water pollution sources, Environmental effects, Degradation(Decomposition), DDT, Oil pollution.
Identifiers: *Baltic Sea, *Flavobacterium.

Between 1971-1973 complex studies on the Baltic Sea pollution were carried out giving special attention to the problems of eutrophication and contamination with hydrocarbons. Eutrophication has been observed in the Baltic Sea during the last 40 years as evidence by an increase in the concentration of nutrients in the sea water, and by a growing number of invertebrates and a higher yield of fish. A total area of 60-80 thousand square km has been devastated by eutrophication in the Baltic Sea. Some species of crustaceans are the most sensitive bioindicators of hydrocarbons in the water of the Baltic Sea while benthic fishes belong to the least sensitive organisms. In the biodegradation of hydrocarbons bacteria of the Flavobacterium genus show the highest activity. Their activity decreases with a decrease in temperature and an increase in the hydrocarbons concentration in the Baltic Sea waters. (Katz)
W76-11185

EFFECTS OF BISULFITE ON METABOLIC DEVELOPMENT IN SYNCHRONOUS CHLORELLA PYRENOIDOSA,
British Columbia Univ., Vancouver. Dept. of Plant Science.
G. Das, and V. C. Runeckles.
Environmental Research, Vol. 7, p. 353-362, 1974. 2 tab., 5 fig., 24 ref.

Descriptors: *Nutrients, Environmental effects, *Algae, Laboratory tests, *Growth rates, Sulfates, *Primary productivity, *Plant growth, *Sulfur compounds, *Toxicity, *Metabolism, Plant physiology, Photosynthesis, Productivity, Plant pathology, Inhibitors, Copper, Magnesium, Sodium, Calcium, Potassium.
Identifiers: *Chlorella pyrenoidosa, *DNA, *Sulfites, *Bisulfite, RNA.

Addition of bisulfite to synchronous cultures of Chlorella pyrenoidosa adversely affects both active growth and cell propagation. Biochemical analysis after treatment showed a differential change in the levels of chlorophylls, protein, RNA and DNA, when expressed as percentages of the cell dry weight: the content of chlorophyll 'b' increased, whereas that of chlorophyll 'a' decreased gradually with increases in HSO3-. The amounts of protein and RNA per unit dry weight remained constant, but DNA levels were markedly reduced. With the exception of iron, the levels of nutrient elements within the cells increased with increasing HSO3- concentration. The relative increases were most marked with K, Mg, Ca, Cu and Na. This suggests that HSO3- adversely affects cell development by impairing DNA synthesis. (Katz)

THE TOXICITY OF THE HERBICIDE DICHLOBENIL TO GOLDFISH (CARASSIUS AURATUS),
Utrecht Rijksuniversiteit (Netherlands). Inst. of Veterinary Pharmacology and Biological Toxicology.
G. Bolier, H. L. Van Der Maas, and R. Bootsma.
Meded Fac Landbouwwet Rijksuniv Gent. 38(3); p 733-740, 1973.

Descriptors: *Toxicity, Water pollution effects, Pesticide residues, Herbicides, Lethal limit, Pollutant identification.
Identifiers: Carassius-Auratus, *Dichlobenil, *Goldfish.

Goldfish were treated for 3 mo. with the herbicide at different dose levels and residues were determined. None of the fish died during the test. Body weight was decreased and the behavior of the animals was abnormal only at the highest concentration (6.4 mg/l) tested. Swimming was with jerky movements and respiration was quick and irregular. This group also had a higher number of granulocytes and less lymphocytes than fish tested at lower pesticide concentrations. No liver lesions were observed. The no toxic effect level for goldfish and continuous exposure during 3 mo. may be given as between 0.4 and 1.6 mg/l in water. The corresponding no toxic effect residue in the whole fish is between 8 and 29 ppm. For use as an herbicide in water, dichlorobenil should be applied at an estimated concentration of 1 mg/l. This recommended dosage does not appear to be a risk to fish life, but it should be noted that reproductive aspects were not covered in this study.--Copyright 1974, Biological Abstracts, Inc.

EFFECTS, UPTAKE AND METABOLISM OF METHOXYCHLOR, MIREX, AND 2,4-D IN SEAWEEDS,
Syracuse Univ., Research Corp., N. Y.
H. C. Sikka, G. L. Butler, and C. P. Rice.
Environmental Protection Agency, Report EPA-600/3-76-048, June 1976. 40 p., 12 tab., 41 ref.

Descriptors: *Pesticides, *Insecticides, *Chlorinated hydrocarbon pesticides, Aquatic plants, *Algae, *Herbicides, *2,4-D, Marine algae, Physiology(Plant), Biochemistry, Laboratory procedures, Carbohydrates, Environmental effects, Degradation(Decomposition), Metabolism, Photosynthesis, Proteins, Laboratory analysis, Lipids, Chlorophyll, Carbon radioisotopes.
Identifiers: *Methoxychlor, *Mirex, Ulva, Enteromorpha, Rhodymenia, Trace metals, Metabolism.

Results are presented of a study concerning effects, uptake, and metabolism of mirex, methoxychlor, and 2,4-D in the seaweeds Ulva sp., Enteromorpha sp., and Rhodymenia sp. None of the pesticides, at concentrations corresponding to their maximum solubility in seawater, had any significant effect on photosynthesis, protein, carbohydrate, lipid, chlorophyll, carotenoid or trace metal content of the algae. All three algae removed substantial amounts of mirex and methoxychlor from the medium, but uptake of 2,4-D was extremely low. The rate of uptake of methoxychlor was considerably greater than that of mirex. Enteromorpha accumulated considerably more mirex and methoxychlor than Ulva or Rhodymenia. Both Ulva and Enteromorpha failed to metabolize either mirex or 2,4-D. Enteromorpha metabolized methoxychlor to a limited extent. After 7 days of incubation with carbon labelled methoxychlor, a major portion of the label in the tissue and medium was present in unchanged methoxychlor. A small amount of radioactive metabolite, 2,2-bis (p-methoxyphenyl) 1,1-dichloroethylene, was detected in both the tissue and medium. In addition, medium contained 2,2-bis (p-hydroxyphenyl) 1,1,1, 1-trichloroethane and four unidentified minor radioactive metabolites. Unlike Enteromorpha, Ulva did not metabolize methoxychlor. (Katz)

EFFECTS OF SULFUR DIOXIDE AND/OR OZONE ON SEVERAL OAT VARIETIES, 1975 ANNUAL REPORT,
North Carolina State Univ., Raleigh
W. W. Heck, and J. A. Dunning
Environmental Protection Agency, Report EPA-600/3-76-032, March, 1976, 73 p., 64 tab., 5 ref.

Descriptors: *Sulfur compounds, Air-water interfaces, *Environmental effects, *Toxicity, *Oats, *Cereal crops, Oxygen, Physiology(Plant), Mortality, Field crops, Statistical analysis, Methodology, Growth rates, *Ozone, Plant growth, Grains(Crop).
Identifiers: *Sulfur dioxide.

Nine experimental designs were run to determine the effect of sulfur dioxide on the important Southeastern oat variety - Carolee. The designs were run under controlled conditions and looked at sulfur dioxide concentration (25-300 pphm), ozone interactions, growth and exposure temperatures, growth and exposure humidities, growth and exposure light intensities, nutrient sulfur levels, number of exposures and exposure ages, and a screen for growth conditions. Plants were grown to from 28 days to 84 days before final harvest. Top dry wt, root dry wt, number of tillers and injury were determined for all experimental designs except No. 5 and No. 8. The fifth design also included yield measurements and the eighth did not include the biomass data. The 75 pphm treatments for 1.5 hrs were close to a threshold dose. Growth environmental factors affected the response of the plants and in some cases exposure conditions caused an effect. Sulfur nutrition was a signification factor and showed an interaction with SO2 concentration on several response measures. Foliar injury was highly correlated with growth reductions. Several designs studied the effects of ozone alone (No. 6, 7, 8) or in combination with sulfur dioxide (No. 13). Two designs utilized 2 additional oat varieties, Salem and Coker 227 (No. 8, 9). TEMPERATURE, INFECTIOUS DISEASES, AND THE IMMUNE RESPONSE IN SALMONID FISH,
Oregon State Univ., Corvallis. Dept. of Microbiology.
J. L. Fryer, K. S. Pilcher, J. E. Sanders, J. S. Rohover,, and J. L. Zinn.
Environmental Protection Agency, Report EPA 600/3-76-021, April, 1976, 72 p., 16 tab., 8 fig., 9 ref.

Descriptors: Freshwater fish, *Salmon, +Mortality, *Water pollution effects, *Trout, Commercial fish, Temperature, *Water temperature, Heated water, Environmental effects, *Thermal stress, Laboratory animals, Animal diseases, Epizootiology, Rainbow trout, *Fish diseases, *Thermal pollution.
Identifiers: *Infectious diseases(Fish), Immune responses, Steelhead trout, Aeromonas salmonicida, Aeromonas liquefaciens, Mortality rates, Antibodies.

Investigations of the effect of temperature on infections of salmonid fish were conducted. Aeromonas salmonicida infection was studied in chinook salmon and steelhead trout; Aeromonas

efaciens infection was studied in chinook and o salmon. In all cases mortality rates were high 4 to 69 F; usually moderate at 54 to 59 F; and or zero at 39 to 49F. Progress of the infections accelerated at higher temperatures and re- ed at lower temperatures. Bacterial kidney dis- was studied in coho salmon and steelhead t. The temperature range of 44 to 54F was op- l for the development of fatal infection as in- ted by mortality rates of 78 to 100%. Higher peratures had a suppressing effect, which was ked at 69F. Temperatures of 59 to 69F were mal for the formation of agglutinating antibody n juvenile coho salmon were injected with a d suspension of A. salmonicida. At lower tem- tures less antibody was formed and no signifi- amount was produced at 39F 60 days after in- on of antigen. Oral immunization of juvenile salmon with a vaccine consisting of formalin d Vibrio anguillarum cells incorporated in diet protected them against fatal infection n the fish were held at temperatures ffom 39 to during immunization. E TOXICITY OF CERTAIN PESTICIDES ARTIA TONSA DANA,
on Labs. America, Inc., Vienna, Va.
hattar, and S. Farley.
nmental Protection Agency, Report EPA 6-033, May, 1976, 29 p., 9 tab., 2 fig., 38 ref.

tors: *Toxicity, *Bioassay, Laboratory s, *Marine animals, Pesticides, ophosphorous pesticides, *Chlorinated arbon pesticides, Crustaceans, *Diazonin, ology, Marine algae, *Pesticide toxicity, ods, Water pollution effects, Reviews.

Identifiers: Calanoid copepods, *Acartia tonsa, Residue analysis, *Methylparathion, *Azodrin, *Toxaphene, Acute toxicity, LC-50.

The acute toxicity to the marine copepod Acartia tonsa Dana of four technical grade insecticides was determined by bioassay using standardized procedures, homogeneous populations and constant laboratory conditions. At a water temperature of 17 + or - 1 deg. C, the 96-hour median lethal concentrations or tolerance limits for methy parathion, Azodrin, diazinon and toxaphene were computed as 0.89 milligrams per liter, 0.24 milligrams per liter, 2.57 micrograms per liter and 7.2 nanograms per liter, respectively. Residue analysis of diazinon at zero and 96-hour exposure time revealed that the mounts of diazinon uptake by three algal organisms are greater than amounts concentrated by the copepod. The toxicity of higher concentrations above 2.0 ppm (2 milligrams per liter) has offset copepod uptake, while at lower concentrations, quantities concentrated by Acartia are negligible. (Katz)

TEMPERATURE EFFECTS OF YOUNG YELLOW PERCH, PERCA FLAVESCENS (MITCHILL),
Environmental Research Lab., Duluth, Minn.
J. H. Mc Cormick.
Environmental Protection Agency, Report EPA-600/3-76-057, May, 1976, 19 p, 2 fig., 31 ref., 1 tab.

Descriptors: *Freshwater fish, *Yellow perch, *Commercial fish, *Juvenile fish, *Mortality, Water pollution effects, Temperature, *Water temperature, Heated water, Environmental effects, *Thermal stress, Growth, Bioassay, Laboratory animals, *Thermal pollution, Juvenile growth stages, Growth rates.

The effect of temperature on growth of young-of-the-year perch was determined over an 8-week period at constant temperatures from 8 deg. to 34 deg C. Absolute growth rate peaked at 28 deg C, but were not significantly less ($P > 0.5$) over the range from 26 deg. to 30 deg. C. Deformities occurred at 32 deg. C but at no lower temperatures, and all fish died within 7 days at 34 deg. C. A suggested seasonal temperature cycle for yellow perch habitats is presented, based on the data from this experiment for the summer period of rapid growth and on data from previous studies for other life stages. STUDIES ON THE SUSCEPTIBILITY OF ANKISTRODESMUS SPECIES TO CRUDE OIL COMPONENTS,
P. B. Kauss, and T. C. Hutchinson.
Verhandlungen International Vereinigung Limnologie, Vol. 19, p. 2155-2164, November, 1975. 8 fig., 1 tab., 15 ref.

Descriptors: *Aqueous solutions, *Productivity, *Inhibitors, *Bioassay, *Algae, *Growth rates, Oil, *Oil spills, *Plant growth, Laboratory tests, Methodology, Primary productivity, Separation techniques, Water pollution sources, Water pollution effects, Environmental effects.
Identifiers: *Ankistrodesmus sp.

Eight species and varieties of Ankistrodesmus, a green alga, were exposed to water soluble crude oil extract to determine variations in the effect of crude oil on algae. The water soluble compounds caused responses varying from growth stimulation to growth inhibition within and among the species. Cells of A. amalloides, A. braunii, A. falcatus var. acicularis, A. nanoselene and A. falcatus var. duplex exhibited a lag phase of 1 to 2 days when exposed to the oil extract. After this period, normal growth resumed. Reduced growth rate was observed in A. nanoselene from day 2 to 10. A. falcatus var. duplex showed a greater rate of growth after the initial lag. Extrapolation of laboratory bioassay data to predict the effects of an actual field spill is difficult due to the effects of evaporation, biodegradation and effects of nonsoluble portions. (Katz)

DIELDRIN AND DDT: ACCUMULATION FROM WATER AND FOOD BY LAKE TROUT (SALVELINUS NAMAYCUSH) IN THE LABORATORY,
Bureau of Commercial Fisheries, Ann Arbor, Mich. Great Lakes Fishery Lab.
R. E. Reinert, L. J. Stone, and H. L. Bergman.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 52-58, 1974. 2 tab, 4 ref.

Descriptors: *Dieldrin, *DDT, *Lake trout, *Lake Michigan, Insecticides, Pesticides, Pollutants, Fish, Trout, Laboratory tests, Biology, Path of pollutants, Water pollution, Chlorinated hydrocarbon pesticides, Organic pesticides, Halogenated pesticides.
Identifiers: *Accumulation of insecticides.

In the laboratory the amounts of dieldrin and p,p'DDT accumulated by fish from contaminated water and food were measured to determine how fish from Lake Michigan accumulate high concentrations of these insecticides from an environment where the concentrations in water are generally less than 0.01 ppb. Eight groups of yearling lake trout (Salvelinus namaycush) were exposed to different combinations of dieldrin and p,p'DDT in water and food. Concentrations of dieldrin and p,p'DDT ranged from 0.006 to 0.010 ppb in water and from 1,700 to 2,300 ppb in food (Oregon moist pellets). After 152 days of exposure to insecticides in water, fish had accumulated an average of 478 ppb dieldrin or 352 ppb p,p'DDT. Fish exposed to dieldrin and p,p'DDT in food accumulated 470 and 648 ppb, respectively. However, it was difficult to determine exactly how much of either insecticide was accumulated from the food because trace amounts (0.003-0.004 ppb) had leached from food or feces. After exposure to the insecticide was terminated, fish eliminated dieldrin at a much faster rate than p,p'DDT. In fish exposed to a combination of dieldrin and p,p'DDT in water and then held for 125 days in uncontaminated water, the total amount of dieldrin declined 89%, but the total amount of p,p'DDT remained unchanged. Data from this study were used to estimate how much p,p'DDT adult Lake Michigan coho salmon (Oncorhynchus kisutch) accumulated from water and from food during a 104-day period (May-August 1968). The estimates suggested that during these months coho salmon accumulated most of the body burden of p,p'DDT from food. (See also W76-11275) (Sims-ISWS)

STORM INDUCED RELATIONSHIPS AMONG CHEMICAL CONDITIONS AND PHYTOPLANKTON IN SAGINAW BAY AND WESTERN LAKE HURON,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. L. Schelske, L. E. Feldt, M. A. Simmons, and E. F. Stoermer.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 78-91, 1974. 5 fig, 6 tab, 7 ref. ERDA C00-2003-23, NSF GA-4507.

Descriptors: *Phytoplankton, *Chemical, *Nutrients, *Lake Huron, * Storms, Sampling, Surveys, Temperature, Hydrogen ion concentration, Chlorides, Turbidity, Chlorophyll, Nitrates, Phosphorus, Silica, Water pollution, Correlation analysis, Chemistry, Biology.
Identifiers: *Saginaw Bay(Mich).

More than 50 stations were sampled in September 1972 to assess environmental conditions in western Lake Huron. Nine transects were sampled, including three south of Saginaw Bay, three north of Saginaw Bay, two in Saginaw Bay and one in the Straits of Mackinac. Chemical and biological characteristics of the stations in Saginaw Bay were markedly different than the other stations sampled: total phosphorus, silica, chloride, chlorophyll a and rates of carbon fixation were larger while nitrate was smaller. Although changes were small, silica, nitrate nitrogen increased and chloride decreased from north to south at the open lake stations. Phytoplankton standing crop were larger in Saginaw Bay than at open-lake stations and tended to decrease with distance from shore on the transects. Average cell counts (4000 cells/ml) in Saginaw Bay were an order of magnitude larger than at the open lake stations. In Saginaw Bay, Anabaena subcylindrica Borge was the dominant form with smaller numbers of Fragilaria capucina Desm. and Melosira granulata (Ehr.) Ralfs. None of these species was dominant at other locations except at a few nearshore stations and at stations near Saginaw Bay. North of Saginaw Bay the phytoplankton assemblage was dominated by eight species of diatoms and small numbers of unidentified flagellates. The abundance of A. subcylindrica populations at stations in and adjacent to Saginaw Bay was related to chloride centration. Silica and chlorophyll a concentrations also behaved as conservative elements at these stations. These data suggest that short-term mixing of Saginaw Bay and open-lake water resulted from strong winds that preceded the sampling. (See also W76-11275) (Sims - ISWS)

CHANGES IN PHYTOPLANKTON FOLLOWING NITRATE PHOSPHATE ADDITIONS TO LARGE ENCLOSURES IN MARION LAKE, BRITISH COLUMBIA,
Ottawa Univ. (Ontario). Dept. of Biology.
M. Dickman.
Schweiz Z Hydrol. 35(1); p 114-120, 1973.

Descriptors: Phytoplankton, Canada, *Nitrate, *Phosphates, Lakes, Water pollution effects, Detergents, Primary productivity.
Identifiers: British-Columbia, *Nitrate phosphate, *Marion Lake (B.C.)

The addition of nitrate, phosphate and a nitrate phosphate combination to replicated wooden enclosures in Marion Lake (Canada) resulted in significant increases in primary productivity and algal standing crop in each of the 3 types of treated enclosures. No single nutrient is likely to simultaneously limit the growth of all phytoplankton species present at any one time in the lake epilimnion. The relevance of this to the detergent controversy is discussed.--Copyright 1974, Biological Abstracts, Inc.

MODELING OF PHYTOPLANKTON IN LAKE ONTARIO,
Manhattan Coll., Bronx, N. Y. Environmental Engineering and Science
R. V. Thomann, R. P. Winfield, and D. M. DiToro
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 135-149, 1974. 12 fig, 2 tab, 13 ref. EPA R800610

Descriptors: *Model studies, *Phytoplankton, *Lake Ontario, *Great Lakes, Mathematical models, Nutrients, Pollutants, Nitrogen, Phosphorus, Carbon, Water pollution, Temperature, Chlorophyll, Biomass, Eutrophication, Epilimnion, Hypolimnion, Biology, Limnology.
Identifiers: *International Field Year for the Great Lakes.

A mathematical model of phytoplankton dynamics in Lake Ontario was developed and compared to observed data. The model is a horizontally well mixed representation of the lake with induced vertical mixing and stratification generating the epilimnion and hypolimnion. A third layer is included to represent the sediment. Phytoplankton chlorophyll, herbivorous and carnivorous zooplankton carbon, three nitrogen forms and two phosphorus forms are the primary dependent variables. Non-linear kinetics and interactions are used throughout to represent such phenomena as nutrient uptake, predation, recycling, and excretion products. Under reasonable sets of model parameters as reported in the literature and used in previous applications of the theory, the model output compared favorably with observed data on the dependent variables. Spring growth and peak chlorophyll concentrations are related primarily to increasing light and temperature. The model indicated that growth ceases due to phosphorus limitation. Zooplankton grazing and subsequent recycling of nutrients due to excretion and plankton respiration result in a late summer increase in phytoplankton biomass. Both nitrogen and phosphorus are then limiting resulting in a broad fall peak in phytoplankton biomass. A decline then results from low temperature due to fall overturn. The model indicated a response time of from 8 to 16 yrs before a decrease in nutrient inputs will completely become effective. (See also W76-11275) (Sims - ISWS)

ASSESSMENT OF THE EFFECTS OF WASTE HEAT INPUTS ON WATER BUDGETS OF THE GREAT LAKES,
Acres Consulting Services, Ltd., Niagara Falls (Ontario).
R. A. Fleming, F. C. Elder, and P. J. Denison.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 389-398, 1974. 3 fig, 4 tab, 14 ref.

Descriptors: *Heated water, *Thermal pollution, *Water loss, *Great Lakes, Powerplants, Nuclear powerplants, Thermal powerplants, Heat, Heat transfer, Evaporation, Water temperature, Cooling towers, Cooling water, Air temperature, Lakes, Limnology, Meteorology.
Identifiers: *International Field Year for the Great Lakes, Evaporative losses, Waste heat.

Monthly heat transfer coefficients were calculated for each of the Great Lakes including Georgian Bay, by means of a steady state model. Overlake meteorological data gathered during the International Field Year for the Great Lakes (IFYGL) provided information on lake modification of atmospheric parameters. Using updated predictions of the waste heat inputs to the Great Lakes in the year 2000 A.D., evaporative losses due to once through cooling were estimated at 1% of the mean flow down the St. Lawrence River. The use of wet cooling towers is expected to increase the losses by 20 to 40%. An estimated 17% of the evaporative losses from either system is expected to be recovered within the basin as precipitation. (See also W76-11275) (Sims - ISWS)
W76-11305

COMPOSITION OF THE OLIGOCHAET FAUNA OF CENTRAL LAKE MICHIGAN,
California Univ., Santa Barbara. Dept. of Biological Sciences.
R. P. Howmiller.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 589-592, 1974. 1 fig, 1 tab, 9 ref.

Descriptors: *Oligochaetes, *Surveys, *Benthic fauna, *Lake Michigan, Worms, Tubificids, Aquatic life, Aquatic animals, Benthos, Sediments, Invertebrates, Annelids, Sludge worms, Water pollution, Pollutants, Sampling, Lakes, Limnology.
Identifiers: Lumbriculids, Enchytraeids.

An account was given of the composition of the oligochaete fauna of the central region of Lake Michigan based on examination of samples from 15 stations. The fauna consisted of Stylodrilus heringianus, Tubifex tubifex, Limnodrilus hoffmeisteri, Lumbricillus, and another enchytraeid which appears to belong to the Henle Enchytraeus group. Stylodrilus heringianus is, by far, the most common and abundant species, occurring at almost 90% ofthe worms examined. One station several miles off Grand Haven, Michig, yielded a sample dominated by Limnodrilus hoffmeisteri. This may be a reflection of local organic enrichment by polluted tributary rivers. (See also W76-11275) (Sims - ISWS)

PHOSPHORUS CYCLING AND LUXU PHOSPHORUS STORAGE BY ALGAE IN T WATERS OF GREEN BAY,
Wisconsin Univ., Green Bay. Coll. of Environmental Sciences.
J. C. Norman, and P. E. Sager.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 \$4.00 in paper copy, \$3.00 in microfiche. Wisconsin Water Resources Center, Madison, Techn Report WIS WRC, 76-04, July 1976. 39 p, 8 fi tab, 32 ref, 3 append. OWRT A-059-WIS(1) 14 0001-4050 14-31-0001-5050.

Descriptors: *Phosphorus compounds, Stor *Algae, *Cycling nutrients, *Water pollution fects, Adsorption, Wisconsin, Lake Michi Phosphates, Biomass, Metabolism, Phytoplankton, Eutrophication, Model stu Bays.
Identifiers: *Green Bay(Wis), Lean's model.

teep gradients in phosphate and phytoplankton iomass concentrations along a transect extending 5 km into Green Bay from the mouth of the Fox iver contrast greatly with apparently uniform hosphorus cycling rates between algae and water the same area. The luxury stoage of phosphorus y algae, expressed on a per unit biomass base, is early the same at all stations along the transect nd in excess of value thought to indicate hosphorus-limited conditions. It is suggested that milarities in turnover rates of phosphorus per nit biomass algae are due to the availability of hosphate in the water at levels well in excess of miting concentrations leading to a saturation ef- ct in phosphorus metabolism by the phytoplank- n. A modification of Lean's four compartment odel of the transfer of phosphorus between solu- e and particulate forms in the epilimnion of lakes necessary to make the model consistent with rtain observed transfer curves. By splitting the rticulate compartment into two distinct frac- ons and incorporating appropriate transfer coef- cients, differential rates of exchange with the rticulate compartment can be simulated. At least o different rates of exchange with the particu- e compartment appear to be necessary to make e model consistent with experimentally ob- rved, diphasic phosphorus transfer curves.

ntifiers: *Fraser River(British Columbia), sin acids, Fatty acids, Juvabione, Hormones.

xicity of pulp and paper mill effluents has been major environmental significance in Canada ce 3 bleached kraft mills were built in the 1960's he Fraser River watershed of British Columbia, of the world's major salmon-producing ers. Since then, regulatory control of the tox- y of Canadian pulp and paper mill discharges been established at the federal and, in some in- nces, at the provincial level. Acute toxicity of st pulp effluents to fish (salmon) has been ex- sively documented. Current studies are ex- ning the toxicity to invertebrates and toplankton (algae). Nonvolatile toxic con- ents of many pulp effluents have been ntified, in most cases accounting for all of the city. Toxicants include resin acids and unsatu- d fatty acids and various derivatives thereof, abione ('paper factor'), and related com- nds, and chlorinated lignin derivatives. Sub- tial sublethal studies have been directed to as- ing the effluent concentration below which no ss is exerted on aquatic organisms. Considera- evidence exists which indicates that this con- ration is about 0.05-0.10 of the 96-hr LC(50) e. The efficiency of biotreatment studies in xifying effluents has been examined. Foam tionation for detoxification is also being con- red. (Sykes-IPC)

TE TOXICITIES OF SPRUCE AND HEM- K BARK EXTRACTS TO SOME UARINE ORGANISMS IN SOUTHEASTERN SKA,
ka Dept. of Fish and Game, Petersburg.
. Buchanan, P. S. Tate, and J. R. Moring.
nal of the Fisheries Research Board of da, Vol. 33, No. 5, p 1188-1192, May, 1976. 1 2 ref, 2 tab.

Descriptors: *Bark, *Toxicity, *Estuaries, Aquatic life, *Water pollution effects, Shrimp, Crabs, Salmon, Pink salmon, Fish, Hemlock trees, *Alaska, Lumbering, Water pollution sources, Pollutans, Aquatic animals, Pink shrimp, Water pollution, Lethal limit, Water quality, Wood wastes, Softwood, Coniferous trees.
Identifiers: Sitka spruce(Picea sitchensis), Western hemlock(Tsuga heterophylla), Dungeness crab(Cancer magister).

Sitka spruce (Picea sitchensis) bark extracts were found to be toxic to adult and larval pink shrimp (Pandalus borealis) and larval Dungeness crab (Cancer magister). Sitka spruce and western hemlock (Tsuga heterophylla) bark extracts were found to be toxic to pink salmon (Oncorhynchus gorbuscha) fry. For salmon fry, toxic effects were observed as soon as 3 hr after exposure to hemlock bark extracts. After a 96-hr exposure, 50% of the test fry were killed at a concentration of 56 mg/liter, 96-hr LC(50). With a 96-hr exposure of spruce extracts, 50% of the fry were killed at concentrations of 100-120 mg/liter. Spruce bark extracts were consistently toxic to all invertebrates tested. The 96-hr LC(50) with larval shrimp, adult shrimp, and larval crabs were 415, 205, and 530 mg/liter, respectively. Using loss of swimming as the criterion, the 96-hr EC(50) for larval shrimp and larval crabs were 155 and 255 mg/liter respectively; EC(50) = medium effective concentration. Spruce bark pulp was 2-6 times more toxic than were extracts to shrimp larvae. (Witt-IPC)

ON-SITE BIOASSAY TESTING AT CARIBOO PULP AND PAPER,
Cariboo Pulp and Paper Co., Quesnel (British Columbia).
R. J. Salmons, and V. E. Johnson.
Pulp and Paper Canada, Vol. 77, No. 5, p 85-86 (T90-91), May, 1976. 1 fig, 2 ref.

Descriptors: *Bioassay, *Toxicity, *Rainbow trout, *Testing procedures, *Pulp wastes, Testing, Equipment, Fish, Effluents, Wastes, Industrial wastes, Water pollution sources, Water pollution effects, *Canada, Foreign countries, Labor, Scientific personnel, Pulp and paper industry, Water pollution control, Water quality control, Monitoring, Pollutant identification.

On-site bioassays with rainbow trout carried out by technical personnel at Cariboo Pulp and Paper Co. (British Columbia) have produced reliable and reproducible results without the use of expensive equipment. Only a few man-hrs/week are necessary to maintain equipment (e.g., glass-fiber holding tanks) and keep a healthy fish stock. The program has proven invaluable both as an effluent toxicity monitor and as a means of determining problem areas in the mill process. (Sykes-IPC)

MERCURY LEVEL AS A FUNCTION OF SIZE AND AGE IN NORTHERN PIKE, ONE AND FIVE YEARS AFTER THE MERCURY BAN IN SWEDEN,
Naturhistoriska Riksmuseet, Stockholm (Sweden).
M. Olsson.
Ambio, Vol. 5, No. 2, p. 73-76, 1976. 2 fig., 4 tab., 25 ref.

Descriptors: *Mercury, *Size, *Pikes, Water pollution effects, *Length, *Pulp wastes, Water quality control, *Absorption, Freshwater fish, Path of pollutants, Public health, Metabolism, Analytical techniques, Fish physiology, *Aging(Biological).
Identifiers: Tissue analysis, *Esox sp., *Sweden.

Mercury levels in a pike population in a lake previously polluted by a papermill decreased after the mercury discharge from the mill ceased. Of five tested parameters of size, length correlated best with mercury levels. For this correlation a significant difference was found between the sexes: males (which grow more slowly) had higher levels than females. Male pike of different ages but the same length showed similar mercury levels. Results indicated that mercury levels in pike increase during starvation. (Katz)

A COMPARATIVE STUDY OF THE EFFECTS ON THE MARINE ENVIRONMENT OF WASTES FROM CELLULOSE INDUSTRIES IN SCOTLAND AND SWEDEN,
Dunstaffnage Marine Research Lab., Oban (Scotland).
T. H. Pearson, and R. Rosenberg.
Ambio, Vol. 5, No. 2, p. 77-79, 1976. 5 fig., 16 ref.

Descriptors: *Bioindicators, *Pulp wastes, Water pollution effects, *Sediments, *Fjords, Ecosystems, Biological communities, *Succession, Populations, *Benthic fauna, *Productivity, Water pollution sources, Benthos, Mollusks, Organic wastes, Analytical techniques, Invertebrates, Biomass.
Identifiers: *Species diversity, *Scotland, *Sweden.

Environmental conditions in two fjordic systems, one in Scotland and one in Sweden, are described and compared. Successional changes in the benthic fauna of the two systems are compared, primarily in relation to the input of organic material from the effluents of pulp and paper mill. Quantitative data are presented on the number of species present, together with abundance and diversity, changes in all of which show similarities in both areas. The relationship between faunal structure and sediment structure is considered; the use of benthic fauna to assess and predict the effect of organic pollution is discussed, and different methods of data presentation are assessed. OLIGOTROPHICATION - A SELF-ACCELERATING PROCESS IN LAKES SUBJECTED TO EXCESSIVE SUPPLY OF ACID SUBSTANCES,
Institute for Water and Air Pollution Research, Stockholm (Sweden).
O. Grahn, H. Hultberg, and L. Landner.
Ambio, Vol. 3, No. 2, p. 93-94, 1974. 2 fig., 14 ref.

Descriptors: *Hydrogen ion concentration, *Acidic water, Aquatic populations, Ecosystems, Environmental effects, *Lakes, *Biomass, *Calcium, Chemical properties, Populations, *Oligotrophy, *Lake stages, *Biota, Mollusks, Mayflies, Balance of Nature, Trophic level, Benthos, Productivity, Mosses, Sampling, Eutrophication, Water pollution effects.
Identifiers: *Oligotrophication, *Sweden.

From integrated biological studies of six acidified lakes (pH values between 4.4 and 5.4) in western Sweden, it has been concluded that primary changes in the composition of plant and animal populations, caused by the supply of acid substances, induce other long-term changes that will perturb the entire lake ecosystem and accelerate further acidification. ganic compounds, *Photosynthesis, Analytical techniques, Tracers, Laboratory tests, Carbon radioisotopes, Methodology, Electron microscopy, *Chlorophyta.
Identifiers: Sub-lethal effects, *Aqueous oil extracts, *Naphthalene, *Chlamydomonas sp.

Investigations were conducted to determine the effects of aqueous extracts of crude oil and naphthalene on Chlamydomonas angulosa in regard to several physiological and morphological parameters. Growth inhibition was dependent on the conditions of treatment and growth stimulation was observed in a 'closed' system containing aqueous crude oil extract. Photosynthetic capacity was immediately and almost completely inhibited following naphthalene treatment. Aqueous crude oil extracts produced a less severe effect. Cellular protein decreased to 66% of the original amount over a 7-day exposure to naphthalene. Recovery was rapid when returned to fresh medium. Napthalene-treated C. angulosa cells became nonmotile due to loss of flagella, developed granulation in the cytoplasm and membrane-like material enveloped the cell. Other morphological changes were observed with both the light and electron microscopes. Similar, but less severe, changes were observed with aqueous crude oil extracts. (Katz)

Identifiers: *Horsetails, *Sedges, Equisetum sp., Carex sp.

To determine the effect of an oil pipeline spill on lakes and ponds in the arctic, oiled and control test cylinders were established in a small lake. Algal species showed reduced productivity after introduction of crude oil into the system. Moss also showed a reduction in productivity that was not statistically significant in terms of control productivity. Chlorophyll a and b concentrations for sedge and horsetails showed significant reductions from surface contamination with oil. Baseline data on several growth parameters of a vegetative subarctic aquatic community were established. (Katz)

PHYTOPLANKTON BIOMASS, SPECIES COMPOSITION AND PRIMARY PRODUCTION AT A NEARSHORE AND A MIDLAKE STATION OF LAKE ONTARIO DURING IFYGL,
Canada Centre for Inland Waters, Burlington (Ontario).
M. Munawar, P. Stadelmann, and I. F. Munawar.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 629-652, 1974. 8 fig, 8 tab, 55 ref.

Descriptors: *Phytoplankton, *Biomass, *Primary productivity, *Lake Ontario, Plankton, Nannoplankton, Surveys, Sampling, Chlorophyll, Algae, Diatoms, Dinoflagellates, Productivity, Nutrients, Water temperature, Size, Lakes, Limnology, Biology.
Identifiers: *International Field Year for the Great Lakes, Nearshore, Midlake, Species composite, Netphytoplankton.

As part of the Canadian contribution to the International Field Year for the Great Lakes (IFYGL), qualitative and quantitative analyses of phytoplankton were carried out at a nearshore and a mid-lake station. Samples were collected on two consecutive days by an integrating sampler (0-10 m) during nine cruises extending from April 1972 to March 1973. Simultaneously, chlorophyll a samples were taken, and carbon-14 uptake was measured in an incubator. About one hundred taxa were identified in samples from each station and contained several phytoflagellates and 'less common' species neglected in other IFYGL investigations. On a biomass basis the 'less common' species contributed significantly to the total phytoplankton biomass. The dominance of phytoflagellates for most of the year at both stations was striking. Similarly, nannoplankton (less than 64 micron) dominated the phytoplankton at both stations throughout the study period. At times more than 85% of the total photosynthesis was due to the nannoplankton fraction. At the nearshore station, phytoplankton biomass and chlorophyll a ranged from 0.2 to 2.3 g/cu m and 1.9 to 8.0 mg/cu m respectively. At the midlake station, the phytoplankton biomass and chlorophyll a ranged from 0.2 to 1.6 g/cu m and from 1.0 to 7.7 mg/cu m respectively. On a volumetric basis, the production/biomass quotient (activity coefficient) ranged between 0.002 to 0.026/hr and 0.002 to 0.02/hr at the nearshore and midlake stations respectively. PHOSPHATE, ALGAE, AND TACONITE TAILINGS IN THE WESTERN ARM OF LAKE SUPERIOR,
Texas Univ. at Dallas. Richardson. Inst. for Environmental Sciences.
R. H. Plumb, Jr., and G. F. Lee.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 2; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 823-836, 1974. 7 fig, 3 tab, 26 ref.

Descriptors: *Phosphates, *Algae, *Mine wastes, *Lake Superior, Eutrophication, Phosphorus compounds, Water pollution sources, Water quality, Phosphorus, Environmental effect, Waste disposal, Lakes, Surveys, Sampling, Leaching, Laboratory tests, Nutrients, Bioassay, Sorption, Primary productivity, Limnology.
Identifiers: *Taconite tailings

The purpose of this investigation was to evaluat the significance and availability of phosphate a sociated with taconite tailings that are presentl being discharged into the Minnesota waters o Lake Superior. Laboratory leaching studie showed that phosphate would not be leached fro tailings in measurable quantities during a thre year period and that phosphate from this source insignificant compared to other sources in th study area. In addition, laboratory bioassays wi Selenastrum and Lake Superior algae as well as in situ bioassays demonstrated tailings to be no stimulatory and non-toxic. Since an observation the primary productivity distribution in th western area, Lake Superior showed no appare effect in the discharge area and agreed with th measured and calculated phosphate flux distrib tion, it was concluded that the discharge taconite tailings would not contribute to th eutrophication of the lake. POPULATION DYNAMICS AND PRODUCTIO OF DAPHNIA HYALINA IN A EUTROPH RESERVOIR,
Freshwater Biological Association, Wareha (England). Windermere Lab.
D. G. George, and R. W. Edwards.
Freshwater Biol. 4(5); p 445-466, 1974.

Descriptors: Algae, Cyanophyta, Daphn *Eutrophication, *Primary productivity, Res voirs, Food chains, Water pollution effects.
Identifiers: *Daphnia-Hyalina, Eglwys Nynydd Wals).

The population dynamics and production of hyalina, the dominant cladoceran in Eglw Nynydd, a shallow eutrophic reservoir in So Wales, were studied for 2 yr against a backgrou of limnological measurements. The appearan and development of successive generations fr egg to adult could be followed from changing nu bers in arbitrarily defined size classes. Seaso variations in mean length, mean brood-size proportion of gravid adults were recorded mean brood-size was related to changing food temperature conditions. Egg-development ti for D. hyalina were determined in culture and population parameters finite birth (B), instanta ous birth (b'), instantaneous population cha (r'), instantaneous death (d') and finite death r (D) were estimated from field data. Turnover production estimates were calculated from fi death rates and biomass. The calculated pote rate of increase (b') was nearly always greater t the observed rate of increase (r'): seas changes in death rate (d') generally par changes in birth rate (b') but remain somewhat of phase. Population oscillations are probably to a delay in the expression of the effects of po lation density upon birth and death rates. production of Daphnia accounts for less than of gross primary production. However, the pat of population growth of Daphnia in Egl Nynydd almost certainly reflects a food lim system. In summer, blue-green algae may be a dant but serve as a poor food source.--Copy 1975, Biological Abstracts, Inc.

OBSERVATIONS ON THE EFFECTS CRUDE OIL POLLUTION ON THE SAN BEACH SNAIL, BUL (GASTROPODA:PROSOBRANCHIATA),
Cape Town Univ. (South Africa). Dept. of Zo gy.
A. C. Brown, P. De B. Baissac, Leon, and Bel Trans R Soc S Afr. 41(1); p 19-24, 1974.

Descriptors: *Oil pollution, *Snails, Water p tion effects, Weathering.
Identifiers: Bullia, Crude oil, Gastrop Prodobranchiata, Snail.

effect of crude oil on Bullia was observed in field, following an oil spill, and in the laboratory using a light Arabian oil. Well-defined stress ptoms appear at sub-lethal concentrations; at er doses these give way to paralysis before h ensues. Very low concentrations are fatal if e is contact between the animals and the oil, if the oil has been weathered. If there is no ct contact much higher concentrations of fresh an be tolerated and weathering greatly reduces effects. Mass mortality is unlikely to occur ugh eating oil-contaminated food.--Copyright , Biological Abstracts, Inc.

AN INTEGRATED STUDY ON THE IMPACT OF METALLIC TRACE ELEMENT POLLUTION IN THE COEUR D'ALENE-SPOKANE RIVERS-LAKE DRAINAGE SYSTEM,
Washington State Univ., Pullman. Dept. of Sanitary Engineering.
W. H. Funk, F. W. Rabe, R. Fibly, G. Bailey, and P. Bennett.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 724, $40.00 in paper copy, $3.00 in microfiche. Joint Project Completion Report Between Washington State University and the University of Idaho, August 1975. 332 p, 89 fig, 81 tab, 166 ref, 4 append. OWRT C-4145(9060)(4).

Descriptors: *Metals, *Trace elements, *Heavy metals, *Washington, Lakes, Rivers, *Food chains, *Productivity, Water quality, Absorption, Zinc, Drainage systems, Copper, Neutron activation analysis, Pollutant identification, Water pollution effects, Iron.
Identifiers: *Trace metals, Coeur d'Alene Lake(Wash), Spokane River(Wash).

Comprehensive limnological, water quality, productivity and substrata investigations have been made of the Coeur d'Alene drainage, Coeur d'Alene Lake and the Spokane River. These investigations were made in an attempt to answer questions as to the passage of metallic elements through the aquatic food chain in the study area as well as to determine the critical factors involved in the poor recovery of the South Fork and main stem of the Coeur d'Alene River. Additional work was carried out to determine the water quality of these areas and the Spokane River. Extensive studies were also made upon the substrata and limiting factors for macroinvertebrates of the Upper Spokane River. Heavy metals, such as Zn, Cu, and Pb, appear to be concentrated to relatively high amounts in algae, aquatic macrophytes and other vegetation growing along the river. Algae and detritus-consuming macroinvertebrates pass these metals along to the fishes. However, there appears to be a reduction of concentration of metals in tissues at each trophic level as one moves up the food chain. The organisms appear to be actively excreting the metals. In the fishes, the filter bodies such as the kidneys and liver confirm this assumption. Nonetheless, the level of Zn, for example, in the muscle tissues of Spokane River fishes may be two to three times that in muscle tissues of the same species taken from undisturbed streams high in Coeur d'Alene drainage. For these reasons it has been concluded that additional efforts should be made to curtail and control seepage from tailings ponds as well as reduction and eventual control of wastes and nutrient runoff in the Coeur d'Alene and Spokane river drainage basins.

AN ENVIRONMENTAL ASSESSMENT OF IMPACTS OF COAL DEVELOPMENT ON THE WATER RESOURCES OF THE YAMPA RIVER BASIN, COLORADO AND WYOMING--PHASE-II WORK PLAN,
Geological Survey, Denver, Colo.
T. D. Steele, I. C. James, II, and D. P. Bauer.
Open-file report 76-368, May 1976. 33 p, 2 fig, 2 tab, 60 ref.

Descriptors: *Environmental effects, *Coal mine wastes, *Water pollution sources, *Energy conversion, *Project planning, Evaluation, Projections, Water resources development, Water rights, Water quality control, Water demand, River basin development, Public lands, Land use, Rehabilitation.
Identifiers: *Yampa River Basin(Colo-Wyo), Residuals management.

The Yampa River Basin Assessment in Colorado and Wyoming is a 2.5-year program of the U.S. Geological Survey. It is designed primarily to assess the availability and quality of the basin's water resources. The basin assessment also will evaluate potential environmental and selected socioeconomic impacts of energy-resource development plans proposed by mining and power companies. This report serves as a project work plan for the basin assessment. It describes the program objectives, and the various approaches of analysis and evaluation. Environmental studies are outlined for analyzing both the direct effects of various proposals regarding coal mining, transportation, and conversion, and the secondary effects resulting from increased population and urban growth. The basin assessment is designed to provide Federal, State and local decision-makers with the basic environmental information needed to formulate and to evaluate policies for the development of energy resources. The techniques applied and conclusions reached in the Yampa River Basin Assessment should aid similar studies in other energy-rich basins in the Western United States. (Woodard-USGS)

RECENT CHANGES IN ATLANTIC SALMON (SALMO SALAR) RUNS IN THE LIGHT OF ENVIRONMENTAL CHANGES IN THE SAINT JOHN RIVER, NEW BRUNSWICK, CANADA,
Environmental Protection Service, St. John's (Newfoundland).
C. L. Dominy.
Biol Conserv. 5(2), p 105-113, 1973.

Descriptors: *Atlantic salmon, *Canada, Rivers, Environmental effects, Waste disposal, *Organic wastes, *Toxicity, Waste assimilative capacity, Water quality, Pollution abatement, Industrial wastes.
Identifiers: *Saint John River(N.B.).

Deterioration of water quality as a result of the disposal of untreated organic and toxic wastes into the Saint John River Basin began when the river was 1st settled in 1604, and the amount of waste entering the river has increased substantially over the past 2 decades. Hydroelectric power developments constructed on the main stem of the river during this recent period have added to the problem by reducing the biological assimilative capacity of the river. The significance of these cultural influences for atlantic salmon (S. salar) in the river has been to reduce the quality of its migration route to and from the sea, to eliminate some of its freshwater spawning and rearing areas, and to cause direct mortality of adult and juvenile salmon. As a consequence, the total salmon stock in the Saint John River has declined by approximately 40% over the past 2 decades. The future prospects for conserving this valuable natural resource in the Sant John River are moderately bright in view of current activities in water pollution abatement, effective regulation of the salmon fisheries, and large-scale artificial propagation.--Copyright 1973, Biological Abstracts, Inc.

HYGIENIC EVALUATION OF AN EPOXY COMPOUND AND THE POSSIBILITY OF ITS USE IN SUBMERSIBLE ELECTRIC PUMPS FOR DOMESTIC PURPOSES, (IN RUSSIAN),
Kiev Research Inst. of General Communal Hygiene (USSR).
V. V. Tsapko, V. N. Kupyrov, V. I. Vorobets, L. P. Vlasova, and G. A. Dolgikh.
Gig Sanit. 10, p 106-107, 1974.

Descriptors: *Organoleptic properties, Oxidation, *Organic compounds, *Animal pathology, Pumps, Rodents, Public health, Toxicity.
Identifiers: *Epoxy compounds, Polyethylene polyamine.

Epoxy compound OKE.504.004, intended for waterproofing the windings of motors of domestic submersible electric pumps, on contacting water for 1 mo. does not affect the organoleptic properties of water. A study of its chemical composition showed an increase of oxidizability and traces of polyethylene-polyamine. Pathological investigations on rats (6-mo. experiment) showed that water in long contact with the epoxy compound causes hemodynamic disorders in the liver, kidneys and adrenal glands, functional changes of the CNS and an increase of the content of ascorbic acid in the adrenal glands and of RNA in the liver. The epoxy compound should not be used for domestic drinking water supply systems, but can be used for waterproofing motors in pumps for watering gardens, washing cars, laundering and other domestic purposes.--Copyright 1975, Biological Abstracts, Inc.

HYGIENIC EVALUATION OF POLYCHLOROPINENE AND ALKYLBENZENE SULFONATE PRESENT TOGETHER IN SURFACE WATERS, (IN RUSSIAN),
Nauchno-Issledovatelskii Institut Epidemiologii, Mikrobiologii i Gigieny, Vilnius (USSR).
D. G. Krasil'shchikov.
Gig Sanit. 10, p 99-100, 1974.

Descriptors: Public health, *Alkylbenzene sulfonates, Organic compounds, *Pesticide residues, *Chlorinated hydrocarbon pesticides, Rodents, Toxicity, Water pollution effects, Detergents, Lethal limit.
Identifiers: *Polychloropinene.

Under model conditions alkylbenzene sulfonate (ABS) and its binary mixtures with the pesticide polychloropinene in concentrations exceeding the maximum allowable concentration (MAC) by 5 fold and more caused inhibition of the level of O2 consumption, the extent of which depended on the concentration of the substances added to river water. Their combined pollution of surface waters can lead to deterioration of the natural self-purification of water from organic pollutants. The long-time intake of polychloropinene, with water at dose levels exceeding the MAC by 10 fold led to the development of functional shifts in rats, and the simultaneous presence of ABS in the water intensified the effect of the pesticide. In concentrations amounting to 1/2 and 1 MAC both substances and their mixtures were inactive with respect to the indices during 7-mo. peroral poisoning of rats. -Copyright 1975, Biological Abstracts, Inc.

INVERTEBRATE FAUNA OF THE LAKES OF THE LOWER TAREYA RIVER (WESTERN TAIMYR), (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Invertebrate Zoology.
N. M. Shabanova.
Vestn. Mosk. Univ. Ser. 6, Biol. Pochvoved. 29(6), p 3-7, 1974.

Descriptors: *Invertebrates, *Lakes, Rivers, *Reservoirs, Ponds, Zooplankton, Daphnia, *Rotifers, *Eutrophication, *Oligotrophy.
Identifiers: Acanthocyclops Capillatus, Asplanchna Sp, Daphnia Arctica, Daphnia Pulex, Diaptomus Bacillifer, Eucypris Glacialis, Eurycercus Glacialis, Heterocope Borealis, Lepidurus Arcticus, Polyartemia Forcipata, Polyarthra Sp, *USSR(Lower Tareya River), Western Taimyr.

Small lakes and pools around the Taimyr station (Russian SFSR, USSR) maintain a fairly diverse fauna of invertebrates. There are some oligotrophic and eutrophic reservoirs as well as intermediate ones. The few small dystrophic reservoirs are shallow with the brown water rich in humic acids. The zooplankton of oligotrophic lakes is characterized by the great variety of wheel animalcules (Rotifera) as compared with other types of reservoirs. Zooplankton analysis showed some common forms (Diaptomus bacillifer, Daphnia pulex, Asplanchna, Polyarthra), and a number of northern species (Heterocope borealis, Acanthocyclops capillatus, D arctica, Eurycercus glacialis, Eucypris glacialis, Lepidurus arcticus, Polyartemia forcipata).--Copyright 1975, Biological Abstracts, Inc.

BACTERIAL POPULATIONS IN SKADAR LAKE, (IN SERBO-CROATIAN),
Zavod Za Biologiju Mora, Kotor (Yugoslavia).
Bosiljka Ristanovic.
Glas Repub Zavoda Zast Prir Prir Muz Titograd, 7, p 37-48, 1974.

Descriptors: *Bacteria, Lakes, Europe, *Oligotrophy, *Anaerobic bacteria, Bioindicators, Cultures, *Aerobic bacteria, Pollutant identification.
Identifiers: Azotobacter-Agilis, Azotobacter, Chroococcum, Beggiatoa-Alba, Beggiatoa-Leptomitiformis, Cellvibrio-Fulvus, Chromatium Minus, Cytophaga-Lutea, Pseudomonas Fluorescens, Siderocapsa, Spirillum-Volutans, *Yugoslavia(Skadar Lake).

During 1972-1973 aerobic and facultative anaerobic bacterial populations in different parts of oligotrophic Skader Lake (Yugoslavia) were investigated. The plate culture method was used. The total number of bacteria was 16-1500/ml of water. The lowest count was in the Radus upwelling spring area in May 1973 and the highest in the zone of macrovegetation in Dec. 1972. Dominant species were: Pseudomonas fluorescens, Migula and Spirillum volutans Ehrenberg. Up to 34/ml nitrogen-fixing bacteria were found, predominantly Azotobacter agilis Beijerinck and A. chroococcum Beijerinck. The number of cellulose-decomposing bacteria was as high as 10/ml. Dominant species were Cytophaga lutea Winogradsky and Cellvibrio fulvus Stap et Bort, which had marginal activity. Sulphur bacteria were Beggiatoa alba (Vaucher) Trevisan, B. leptomitiformis Trevisan and Chromatium minus Winogradsky. The only Fe bacterium detected was Siderocapsa major Molisch. Only 3.2%-14.5% of the ammonificators tested survived in media with a phenol concentration of 10 mg/l, and only 0.07%-2.6% on a phenol concentration of 1 mg/l. Bacteriological processes were probably most intensive in Skadar Lake because of the best stand of aquatic plants and favorable temperature and O2 relations. The transformation of organic matter is slow and scanty.--Copyright 1975, Biological Abstracts, Inc.

THE HYPOTHALAMO-HYPOPHYSEAL NEUROSECRETORY SYSTEM OF THE GUPPY LEBISTES RETICULATUS UNDER CHRONIC PHENOL INTOXICATION, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
V. E. Matei.
Zh Evol Biokhim Fiziol. 9(5), p 481-486, 1973.

Descriptors: *Phenols, *Toxicity, Water pollution effects, Fish.
Identifiers: Guppy, Intoxication, *Lebistes-Reticulatus, *Neurological fish studies(Hypothalamo-hypophyseal).

Phenol in minimal subtoxic concentrations enhances the activity of the hypothalamo-hypophyseal neurosecretory system (HHNS) of the fish. Higher concentrations of the agent induce active excretion of neurohormone from the HHNS up to its complete devastation. The neurohypophysis exhibits the highest reactivity under stress situations. Phenol intoxication results in phase changes in the HHNS, which are accompanied by disturbances in the higher nervous activity of fishes.--Copyright 1975, Biological Abstracts, Inc.

DDT AND ITS METABOLITES IN SOME CESTODES IN FISHES, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
I. I. Perevozchenko, and O. N. Davydov.
Gidrobiol Zh. 10(6), p 86-90, 1974.

Descriptors: *DDT, Fish, Absorption, *Pike, *Carp, Toxicity, Lethal limit, Water pollution effects.
Identifiers: Bothriocephalus-Gowkongensis, *Cestodes, Ligula-Intestinalis, *Metabolites(DDT), Triaenophorus-Nodulosus.

The ability of Bothriocephalus gowkongensis, Triaenophorus nodulosus and Ligula intestinalis to rapidly accumulate p,p'-DDT, p,p'-DDD and o,p'-DDD via their fish host (pike, carp) and in vitro was determined. A considerable resistance of cestodes in solutions of the toxicants lethal for their hosts (100 and 1000 micro-g/l) was noted. The ability of cestodes to dechlorinate p,p'-DDT was shown and distinct desorption of p,p'-DDD and its o,p'-isomer from tissues of the 'poisoned' L. intestinalis when placed in a normal Ringer's solution was noted. Preliminary experiments on the effect of p,p'-DDT on yearling carp showed that death among the fish infected with B. gowkongensis was greater than among the uninfected.--Copyright 1975, Biological Abstracts, Inc.

INCREASE OF PRIMARY PRODUCTION IN A BAY OF MALYI ZHEMCHUZHNYI ISLAND (NORTH CASPIAN) USING INORGANIC FERTILIZERS, (IN RUSSIAN),
Kaspiiskii Nauchno-Iseledovatelskii Institut Rynogo Khozyaistva, Astrakhan (USSR).
V. A. Vnukov, G. G. Evstigneev, and V. I. Konev.
Gidrobiol Zh. 10(4), p 90-94, 1974.

Descriptors: *Primary productivity, Bays, *Fertilizers, Inorganic compounds, *Phytoplankton, Lakes, Photosynthesis, Islands, *Phosphates, *Nitrates.
Identifiers: *Caspian Sea, USSR(Zhemchuzhnyi Island), Bay of Malyi.

Experiments in 2 bays on Malyi Zhemchuzhnyi Island (North Caspian) (USSR) showed that the application of superphosphate and ammonium nitrate in the experimental bay changed the quantitative content of biogenous elements in it: the content of phosphate P increased to 63.90 mg/m3 and NH3-N to 62.50 mg/m3 whereas in the control bay these values were, respectively, 22.05 and 47.00 mg/m3. Photosynthetic activity of phytoplankton increased in the experimental bay from 8.23-8.88 and in the control bay from 8.33-8.54. The presence of additional biogenous substances involved a marked increase of the gross primary production of plankton to 10.88 mgO2/l in the experimental bay vs. 0.65-5.07 mgO2/l in control.--Copyright 1975, Biological Abstracts, Inc.

EFFECT OF THE DEGREE OF VACUUM USED IN FILTRATION ON THE SIMULTANEOUS MEASUREMENT OF ASSIMILATION AND EXCRETION BY PHYTOPLANKTON ORGANISMS, (IN FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Abidjan (Ivory Coast). Centre de Recherches Oceanographiques.
A. Herbland.
Cah O R S T O M Ser Oceanogr. 12(3), p 173-178, 1974.

Descriptors: *Filtration, *Phytoplankton, Filters, Vacuum, *Absorption, *Measurement, Coasts, Organic matter, Pollutant identification.
Identifiers: Excretion(Phytoplankton), *Mauritania.

The amount of vacuum applied to draw water through the filter is an important source of error in determining, simultaneously, phytoplankton assimilation and organic excretion. An experiment made in coastal Mauritanian upwelled waters with a natural population, shows that the suction must not exceed 75 mm Hg. The reproducibility of total organic production, assimilation and excretion measurements is not disturbed by increasing suction while the reproducibility of the ration excretion: excretion + assimilation is better with low vacuum. The spatial heterogeneity of phytoplankton cells is an important cause of variability in primary production measurements, while a functional or physiological homogeneity exists in the sub-samples.--Copyright 1975, Biological Abstracts, Inc.

PRIMARY PRODUCTION IN THE MAURITANIAN UPWELLING IN MARCH 1973, (IN FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Abidjan (Ivory Coast). Centre de Recherches Oceanographiques.
A. Herbland, and B. Voituriez.
Cah O R S T O M Ser Oceanogr. 12(3), p 187-201, 1974.

Descriptors: Carbon radioisotopes, *Primary productivity, Organic matter, *Bacteria, Nutrients, *Phytoplankton, Zooplankton, Oxygen, *Chlorophyll, Nitrogen, Coasts, Absorption.
Identifiers: Carbon-14, *Mauritania.

Newly upwelled water was followed with a drogue for 6 days in the Mauritanian upwelling. The particulate organic production was estimated by 3 methods: the increase of chlorophyll a (delta Chla); the increase of particulate C (delta Cp) and the sum of daily C14 primary production. A comparison between these 3 methods shows a regular decrease (100-25) of the ratio Cp/Chla, good agreement between the 2nd and 3rd methods during the morning and a difference for 24 h periods probably due to nightly grazing (between 20-30% of the net

LIBRARY U. OF I. URBANA-CHAMPAIGN

primary production). The dissolved organic production (phytoplankton excretion) was directly measured and estimated to be 42% of total organic production, but there is evidence of overestimation and it probably did not exceed 20%. The ratio excretion/excretion + assimilation had diel variations with higher values during the afternoon. The nutrient decrease and the chlorophyll a and O2 increase were very important in the morning, but weak or absent in the afternoon. Comparison of dissolved organic P in seawater with direct excretion of phytoplankton and zooplankton seems to show an immediate re-utilization of excreted dissolved organic compounds by heterotrophic bacteria. The atomic ratio of nutrients uptake vs. the C uptake delta C/delta. NO3/delta SiO3/delta PO4 were equal to 60/12/9/1. Silicate was the 1st nutrient deficient. Ammonia is taken up quickly but in small quantity compared to nitrate; nitrite appeared to be marginal in the main N flux. The evolution of O2 distribution cannot be explained by photosynthesis process only; there is evidence of important enrichment by atmospheric exchanges.--Copyright 1975, Biological Abstracts, Inc.

FEATURES OF FRESHWATER ECOSYSTEMS (FROM THE RESULTS OF SOVIET PARTICIPATION IN THE INTERNATIONAL BIOLOGICAL PROGRAM), (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institit.
G. G. Vinberg.
Izv Akad Nauk SSSR Ser Biol. 1, p 83-93, 1975.

Descriptors: *Bacteria, *Ecosystems, Freshwater, Lakes, Reservoirs, *Phytoplankton, *Predation, *Metabolism, Zooplankton.
Identifiers: *International Biological Program(USSR).

Investigations of energy flow in ecosystems of 10 lakes and 2 reservoirs of a different geographical location show a very large range of primary phytoplankton production (P1), 21-1758 kcal.m-2.yr-1. In spite of this the relative production values of bacterioplankton (Pb), non-predatory (P2) and predatory (P3) planktonic and benthic animals vary irregularly around mean values: Pb, 31 (20-46); P2, 10.3 (4.3-16.2) and P3, 49 (20-77). The expenditures for the metabolism of bacterio-, phyto- and zooplankton calculated on the basis of respective production values are in close positive correlation with P1 and, on the average, approach P1.--Copyright 1975, Biological Abstracts, Inc.

THE PATTERNS OF 14C ACCUMULATION AND REMOVAL IN FRESHWATER FISHES, (IN RUSSIAN),
Institute of General and Municipal Hygiene, Moscow (USSR).
G. V. Fedorova.
Zh Obshch Biol 35(4), p 631-639, 1974.

Descriptors: *Carbon radioisotopes, *Distribution patterns, Organic compounds, Inorganic compounds, *Carp, Freshwater fish, Fish pathology.
Identifiers: *Carbon 14, *Loach, *Guppy.

The patterns of accumulation and removal injected 14C both in organic and nonorganic compounds from the water, food, and food and water simultaneously were revealed in the organs and tissues of freshwater fishes (carp, guppy, loach, orfe). Liver, kidneys, gastrointestinal tract, gills, brain were found to accumulate 14C on a large scale. Muscles, skin and eyes accumulate 14C to a smaller extent. A different capacity for accumulation of 14C is observed at subcellular level in the mitochondria. In stomach mitochondria 14C accumulation proceeds much more extensively than in muscle mitochondria. The removal of 14C from the organs and tissues of fishes proceeds much slower as compared with accumulation irrespective of the means of administration.--Copyright 1975, Biological Abstracts, Inc.

MASS DESTRUCTION OF SYNTHLIBORAMPHUS ANTIQUUS BY OIL POLLUTION OF JAPAN SEA,
Niigata Prefecture (Japan). For. Div.
T. Kazama.
Misc Rep Yamashina Inst Ornithol 6(4), p 389-398, 1971.

Descriptors: *Oil pollution, Water birds, Water pollution effects, Oil spills.
Identifiers: Aethia-psittaculus, Brachyramphus-marmoratus, Calonectris-leucomelas, Cerorhinca-monocerata, Destruction, Gavia-artica, Gavia-stellata, *Japan Sea, Larus-argentatus, Lunda-cirrhata, Rissa-tridactyla, Synthliboramphus-antiquus, Uria-lomvia, *Sea birds.

A number of sea birds dead as a result of oil pollution had been found on the beach of Kashiwazaki, Niigata prefecture (Japan) since 1959. The dead birds included S. antiquus, Uria lomvia, Brachyramphus marmoratus, Cerorhinca monocerata, Lunda cirrhata, Aethia psittaculus, Rissa tridactyla, Larus argentatus, Calonectris leucomelas, Gavia stellata and Gavia arctica. Alcids were especially affected by the pollution and the ancient auklet, S. antiguus, was the most usual species. Thirty examples of the auklet were selected for anatomical analysis. They were grouped into 3 categories with respect to body weight and amount of fat and oil attached. The most severely polluted example had an oil weight comprising 50% of the body weight; it had the least fat. Other birds still had some fat. The oil was found even in the digestive tract. Ship oil was being cast offshore in the Japan Sea and was drifting ashore by prevailing winds.--Copyright 1976, Biological Abstracts, Inc.

CONTAMINATION OF THE SEA, (IN SPANISH),
J. Noguera Talar.
Inmersion Cienc 8/9, p 43-46, 1975.

Descriptors: *Sea basses, Fish, Water pollution. Identifiers: Croaker, Gilthead, Sea slug, *Spain, Vegetation, Sheep's head(Fish), *Noise pollution(Water).

The disappearance of fish (sheep's head, gilthead, croaker, seabass, etc.) from shores (Spain), that formerly abounded in these species, was probably caused by the intrusion of man rather than pollution. Pollution may be responsible for the loss of ocean bottom vegetation and such fish food as sea slugs, but illicit dragnetting operations, underwater drilling for petroleum and especially the noise made by motor boats are more destructive. Noise is probably one of the prime factors in driving away fish from certain spots. In areas recently disturbed by man, an abundance of fish is found.--Copyright 1976, Biological Abstracts, Inc.

DETOXICATION IN PLANTS OF TOXIC SUBSTANCES FROM INDUSTRIAL SEWAGE USED FOR IRRIGATION, (IN RUSSIAN),
Central Research Station Agricultural Use of Sewage, Noginsk (USSR).
S. I. Khramova, and K. S. Bokarev.
Fiziol Rast 20(6), p 1257-1260, 1973.

Descriptors: *Water reuse, Aromatic compounds, Sewage, Industrial wastes, Organic compounds, *Toxicity, Irrigation, Carrots, Corn(Field), Grasses, Effluents.
Identifiers: *Aromatic hydrocarbons, *Detoxification(Plants).

Dynamics of the content of aromatic hydrocarbons in soil and in maize, grass and carrot were studied during irrigation with chemical industrial sewage. These compounds were detected in the plants 1-5 days after irrigation, varying according to plant species. Decomposition of these toxic compounds in soil is rather slow--about 10 days after irrigation. The plants are suggested for detoxification of organic contaminants in industrial sewage.--Copyright 1976, Biological Abstracts, Inc.

EFFECTS OF ENRICHED DIET WITH IRON IN CULTURE OF YELLOW-TAIL, (IN JAPANESE),
Tokyo Univ. of Fisheries (Japan). Radioisotope Research Lab.
Y. Ikeda, H. Ozaki, and K. Uematsu.
J Tokyo Univ Fish 59(2), p 91-99, 1973.

Descriptors: *Fish diets, *Iron, Proteins, Water pollution effects, Absorption.
Identifiers: Anemia, Erythrocyte, Seriola-quinqueradiata, *Yellow-tail.

The effects of Fe on anemia in yellow-tail (Seriola quinquera-diata) fed on raw fish were studied. The decreasing orders of body weight, erythrocyte count, Hb level, color index and serum protein level after feeding for about 4 mo. were: raw fish > 57.3mg% added Fe > 7.3mg% added Fe.> Although decreasing orders of liver, kidney, spleen, and heart weight were 7.3mg% added Fe > 7.3mg% added Fe > raw fish, the effects of Fe enrichment were observed on the digestive organs. Serum Fe level was highest in a diet with 57.3mg% of Fe, and lowest in 7.3mg% Fe. Absorption of 59 Fe was highest with 7.3mg% Fe and lowest with 7.3mg%. A diet enriched with Fe revealed almost the same Price-Jones curve as that of fish fed on raw fish.--Copyright 1976, Biological Abstracts, Inc.

PHYSICO-CHEMICAL PARAMETERS OF THE HYDROGRAPHIC SYSTEM OF LAKE NANTUA: RELATION WITH OSCILLATORIA, (IN FRENCH),
Station d'Hydrobiologie Continentale, Thonon-les-Bains (France).
J. Feuillade, and A. Orand.
Ann Hydrobiol 5(2), p 95-120, 1974.

Descriptors: Algae, Effluents, Lakes, Water pollution, Sewage, Phosphorus, Nitrates, Light, Physicochemical properties.
Identifiers: *France(Lake Nantua), *Oscillatoria.

Hydrological, meteorological and physico-chemical variations were studied in the influent and effluent of Lake Nantua (France). This work started in May 1969 and was completed in May 1972. After this date half the sewage was diverted from the lake's and conducted to the treatment plant below the lake. The data were converted into the weight of an element carried per second. The study pointed out the existence of sub-lacustrine springs. An increase was observed in the amount of total P input since 1970 (before the building of the sewage pipes). P enrichment of waters by the town is evident, but NO3 is naturally present in these waters. Factorial analysis of correspondances shows that sunlight duration is the main variable controlling the number of algae in the lake.--Copyright 1976, Biological Abstracts, Inc.

PRIMARY PRODUCTION AND BIOTIC BALANCE OF PLANKTON IN THE NORTHEASTERN PART OF THE AMUR BAY, (IN RUSSIAN),
Akademiya Nauk SSSR, Vladivostok. Institut Morskogo Biologii.
I. F. Rassashko.
Okeanologiya. 14(4), p 693-698, 1974.

Descriptors: *Primary productivity, Bays, Respiration, *Phytoplankton, Chlorophyll, Seasonal.
Identifiers: *USSR(Amur Bay), *Biotic balance.

The waters of the NE part of the Amur Bay (USSR) are highly productive. The maximum phytoplankton primary production was about 1000 mgC.M-3/day at a near-shore station and 810 mgC.mg-3/day at a central station. Extremely high assimilation numbers from 57.2-162.0 mgC. mg chlorophyll-1 h were recorded. Primary production is in excess of plankton losses for respiration; the biotic balance of plankton is positive. During 1 yr, primary production varied considerably with minimum in winter and a maximum at the end of summer and in autumn. The differences between the seasons are statistically reliable. A close correlation (R = +0.85) was found between primary production at the surface (X) and below 1 m (Y). The relationship between these 2 values is expressed by the equation y = 1.71 + 3.1 x.--Copyright 1975, Biological Abstracts, Inc.

THE EFFECTS OF NTA ON THE GROWTH OF PHYTOPLANKTON WITH PARTICULAR CONSIDERATION GIVEN TO IRON AS A MICROELEMENT,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
H. Buergi.
Schweiz Z Hydrol. 36(1), p 1-70, 1974.

Descriptors: *Nitrilotriacetic acid, *Iron, *Growth rates, *Phytoplankton, Photosynthesis, Metals, Eutrophication, Lakes, Effluents, Mesotrophy, Water pollution effects, Acids, Trace elements.
Identifiers: Acetic acid, *Switzerland(Lake Lucerne), Switzerland(Greifensee).

While nitrilotriacetic acid (NTA) or Fe may stimulate phytoplankton photosynthesis on a short-term basis in mesotrophic Lake Lucerne (Switzerland), they impede this process in the eutrophic Greifensee. After a few days this reaction tapers off. It is highly unlikely that Fe acts as a growth-limiting factor; the Fe which inevitably gets into lakes through wastewater treatment plant effluents as a result of tertiary treatment (precipitation with Fe3+) will not have a long-term stimulating effect on plankton production. Both Fe-through adsorption-and NTA-through chelation-reduce the supply of free ions of various metals, especially Cu. Since these free ions are needed for plankton growth, and yet have a toxic effect even in small quantities (micro g/l), the medium can, through addition of Fe or NTA, be detoxified or the trace metals limited, with corresponding increase or curtailment of algal production. The different patterns for the 2 lakes can be explained by the influence of natural organic materials on the free ions.--Copyright 1975, Biological Abstracts, Inc.

EFFECT OF TREATED SEWAGE EFFLUENTS ON PHYTOPLANKTON IN LAKES, (IN GERMAN),
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
P. Bossard, and H. Ambuehl.
Schweiz Z Hydrol. 36(1), p 187-200, 1974.

Descriptors: Water pollution effects, *Sewage effluents, Lakes, *Phytoplankton, *Algae, *Growth rates, Phosphorus, Nitrogen, Iron, Bioassay.

The effect of domestic sewage effluents after mechanical, mechanical-biological and mechanical-biological-chemical treatment on algal cultures and on natural lake phytoplankton was studied by means of laboratory assays and in situ experiments. The concentrations of P and N are almost exclusively responsible for any algal growth. Other constituents which may be present in sewage effluents (e.g.), residual amounts of Fe originating from the tertiary treatment) do not substantially stimulate the growth of algae.--Copyright 1975, Biological Abstracts, Inc.

ABSORPTION AND ACCUMULATION OF PESTICIDES RESIDUES AND CHLORINATED BIPHENYLS IN BOTH WILD AQUATIC VEGETATION AND RICE IN THE CAMARGUE REGION, (IN FRENCH),
Centre National de la Recherche Scientifique, Arles (France). Centre Ecologie Camargue.
A. Vaquer.
Oecol Plant 8(4), p 353-365, 1973.

Descriptors: *Pesticide residues, *Absorption, Algae, *Polychlorinated biphenyls, Deltas, Rice, *DDT, Plant physiology, *Bioindicators, Water pollution, Vegetation.
Identifiers: *France(Rhone delta).

The residues from certain chemicals (pesticides and polychlorinated biphenyls (PCB's) present in relatively small quantities in the various aquatic habitats in the Camargue region (Rhone delta),

LIBRARY U. OF I. URBANA-CHAMPAIGN

France, were investigated in some aquatic and semi-aquatic plant species, including rice. These plants absorb and concentrate the products (alpha- and gamma- BHC, DDT and PCB's) to levels of 16-20,000 times (dry weight) that of water, varying with the species. The products absorbed are not spread homogeneously throughout the plant but are generally stored at higher levels in the leaves than in the roots and at the base of the stem. The concentrations in the fruit are higher than in the plant itself. Specific differences in concentrations are due to differences in stage of development, absorbing qualities and metabolic activity, particularly degradation. Because of their high accumulating capacity, algae seem to be good indicators of the degree of water pollution.--Copyright 1976, Biological Abstracts, Inc.

SUPERSHRIMP: DEEP BIOTURBATION IN THE STRAIT OF CANSO, NOVA SCOTIA,
McMaster Univ., Hamilton (Ontario). Dept. of Geology.
G. S. Pemberton, M. J. Risk, and D. E. Buckley.
Science, Vol. 192, No. 4241, 21 May 1976, p. 790-791. 2 fig., 5 ref.

Descriptors: Marine animals, *Sediments, *Benthos, *Crustacean, *Oil pollution, *Habitat improvement, Pulp wastes, Industrial wastes, Habitats, Sediment-water Interface, Organic wastes, *Canada, *Shrimp.
Identifiers: *Axius serratus, *Mud shrimp, Burrowing shrimp, *Strait of Canso(NS).

Axius serratus, a crustacean thought to be extremely rare, was discovered in large numbers in polluted regions of the Strait of Canso. The shrimp may live deeper than 3 meters in the sediment; burrows are kept open to at least 2.5 meters. Sediment contained in old filled burrows is anomalous in its distribution of particle size and its content of water, organic carbon, and trace elements. These anomalous qualities affect the geotechnical properties of sediments on the sea floor. (Katz)

REDUCTION OF FIELD POPULATIONS OF FIDDLER CRABS BY UPTAKE OF CHLORINATED HYDROCARBONS,
Marine Biological Lab., Woods Hole, Mass.
Boston Univ. Marine Program.
C. T. Krebs, I. Valiela, G. R. Harvey, and J. M. Teal.
Marine Pollution Bulletin, Vol. 5, No. 9, 1974, p. 140-142, 3 tab., 24 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Polchlorinated biphenyl, *DDE, *Sewage sludge, *Bioassay, *Crabs, Behavior, *Aldrin, *Dieldrin, Crustaceans, Fertilzers, *Massachusetts, Marshes, *Salt marshes.
Identifiers: *Great Sippewissett marsh(Mass), West falmouth(Mass), Fiddler Crabs, Uca pugnax

Fiddler crabs are particularly sensitive to chlorinated hydrocarbons. Crabs that have been feeding on contaminated material show an impairment of their escape reaction. High concentrations of Aldrin and Dieldrin in plots of marsh experimentally treated with contaminated sewage sludge indicate that these insecticides are responsible for a drastic reduction in fiddler crab populations. (Katz)

FLUORIDE IN MARINE ANIMALS,
Newcastle-upon-Tyne Univ. (England). Dept. of Plant Biology.
D. A. Wright, and A. W. Davison.
Marine Pollution Bulletin, Vol. 5, No. 8, 1974, pp. 119-121, 3 tab., 11 ref.

Descriptors: *Fluorides, *Marine animals, *Industrial effluents, Birds, Fish, *Invertebrates, *Food chains, Commercial fish, *Shrimps, Water pollution, Aluminum, Path of pollutants, Public health.
Identifiers: Cod, Haddock, Aluminum smelter, Tissue concentration, Flounders, Sprat, Northumberland coast.

Fluoride in a greatly diluted form is part of the effluent from an aluminum smelter on the Northumberland coast in north-east England. Fluoride is concentrated in the skeleton of birds, fish and in vertebrates and to a smaller extent in the skin of fish. All concentrations found both in the seawater and in local animals are within the normal range and it is unlikely that the additions from the smelter materially affect the situation. Since fluoride concentrates in inedible tissues there appears to be little health risk from this source in seafood. (Katz)

OBSERVATIONS ON THE CESTODE EUBOTHRIUM SALVELINI IN JUVENILE SOCKEYE SALMON (ONCORHYNCHUS NERKA) AT BABINE LAKE, BRITISH COLUMBIA,
Fisheries and Marine Service, Nanaimo (British Columbia). Biological Station.
H. D. Smith.
J Fish Res Board Can. 30(7), p 947-964, 1973.

Descriptors: *Sockeye salmon, Lakes, *Canada, *Smolt, Plankton, *Fish diseases, *Fish parasites, Fish growth, Fish behavior, Zooplankton.
Identifiers: Cestode, Eubothrium-salvelin, Oncorhynchus-nerka, *Babine Lake(BC).

Infection incedence among 15 brood years of smolts in the period 1952-71 was estimated from smolt and underyearling samples, and among late run fish from the main part of Babine Lake (Canada) ranged from 6-45% (average 26%). In early run fish from the North Arm-Nilkitkwa area it ranged from 5-46% (average 22%) in 10 yr during 1958-71. Infection intensity changed substantially during 1967; but about 1 fish in 8 or 200,000 individuals in the early run, carried parasite loads greater than or equal to 10% of fish weight. Mature E. salvelini (Schrank 1790) averaged 32 mg in weight and 34 mm in length during a period of high incidence and intensity of infection 1967. Although no proof was found of direct mortality caused E. salvelini, indirect effects such as inferior growth, poor swimming performance, or aberrant behavior due to large cestode loads may increase host susceptibility to death from other causes. Changes in relative abundance of the zooplankton intermediate host, and midsummer shifts in feeding preferences of young sockeye likely account for increasing infection incidence in June and July, and stable incidence thereafter.--Copyright 1973, Biological Abstracts, Inc.

CONTINUED STUDIES (PHASE II) IN THE SEARCH FOR A PREDICTIVE MODEL FOR SLUDGE CHARACTERIZATION USEFUL TO DESIGN AND CONTROL OF SLUDGE DEWATERING PROCESSES IN WATER RECYCLE SYSTEMS,
Maine Univ., Orono. Land and Water Resources Inst.
E. G. Bobalek, R. E. Durst, B. Yadeta, and B. A. Cook.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-256 237, $5.00 in paper copy, $3.00 in microfiche. Report No. 5-75, June 1975. 76 p, 11 fig, 15 tab, 12 ref, 3 append. OWRT B-009-ME(1). 14-01-0001-4089.

Descriptors: *Sludge treatment, *Sewage sludge, *Dewatering, Model studies, Filtration, *Kinetics, Recycling, Waste water treatment, Waste treatment, Waste identification, Correlation analysis.
Identifiers: *Sludge dewatering, Sludge handling, Dewatering model, Sludge aging.

Phase II of continuing studies to develop a predictive model for sludge characterizations was directed toward: (I) Exploring the value of the model that relates filterability to one static chemical parameter (the bound water) for complex sludges; and (II) Replacing the exacting and tedious experimental methods developed earlier for data retrieval with more convenient procedures. The goal of greater experimental convenience was achieved by (A) Replacing the laboratory filter cell system with a pilot plant scale rotary filter; and (B) Replacing the vapor pressure isotherm method for bound water measurement with a convenient instrumental method that senses relative humidity over a single sample of progressively-dried sludge cake. The goal of extending or improving the original quantitative model to make filterability predictions was frustrated when physicochemical aging effects of the complex sludges were observed. It became apparent that detailed knowledge of how hydrodynamic parameters depend upon sludge chemistry was necessary. Thus the original correlation model which ignores aging kinetics was found to be too simple for general use. However, a new laboratory method was developed which can track short and long term kinetics for most sludges provided proper sampling is conducted. (See also W74-10528) (Hutchins-Maine)

MUNICIPAL WASTES AS A FERTILIZER SOURCE,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
J. R. Gilley.
Available from NTIS Springfield, Va., 22161, as PB-256 206, $3.50 in paper copy, $3.00 in microfiche. Journal Series Paper No. 5042, University of Nebraska Agricultural Experiment Station, presented at 1976 Sprinkler Irrigation Association Technical Conference in Kansas City, February 24, 1976. (1976). 14 p, 2 fig, 4 tab, 14 ref. OWRT A-041-NEB(1). 14-34-0006-6028.

Descriptors: *Municipal wastes, Sludge, Effluents, Fertilizers, *Organic wastes, Land management, Application rates, Crop production
Identifiers: *Land application.

Municipal sewage wastes, sludges and effluents can be used on land for crop production with benefits for both agricultural and urban interests, but the waste and the land must be carefully managed to achieve favorable results. Successful land utilization of municipal wastes for crop production requires the usual basic soils, climate and crop information. However, because of the nature of the material being placed on the land and public reaction to it, soil-plant management information becomes even more important. The objective in many waste application systems is to maximize waste application to the land while preventing environmental contamination and in addition to produce an acceptable crop yield. Accomplishing this often requires considerable adjustments from the usual crop and soil management practices. Organic wastes can be used safely and effectively to increase soil productivity if proper precautions are taken concerning heavy metals, toxic chemicals, nitrate leaching, erosion losses and undesirable odors. When applied at crop use rates and with proper soil management, most municipal wastes present no serious environmental hazards and should be considered a resource that agriculture can very well use.

HYDRAULIC COLLECTION AND DISPOSAL OF REFUSE,
Meta Systems, Inc., Cambridge, Mass.
J. Kuhner, and P. M. Meier.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE4, Proceedings paper 12296, p 769-788, August 1976. 4 fig, 5 tab, 21 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Solid wastes, *Systems analysis, *Sewage treatment, Simulation analysis, Mathematical models, Hydraulics, Sludge disposal, Management, *Waste water treatment.
Identifiers: *Cost effectiveness, Refuse, *Refuse disposal, Wet system.

A concept for residential refuse management is examined that calls for individual household refuse grinders, dilute slurry transport of ground refuse in the existing sanitary sewer system, and joint treatment of refuse and sewage at an expanded treatment facility that includes anaerobic digestion for methane generation. Hydraulic transport of ground refuse in existing sewer systems may be feasible only if both metals and glass are excluded, and a conventional collection of the nongrindable and bulky constituents of residential refuse will still be needed. The total 1973 cost of such a wet system is estimated at between $110 and $200 per household per year, of which $80-$105 is used for grinding. This compares to a total cost for sewage and refuse collection and disposal under existing concepts of $40-$115 per household per year. If the cost of the grinder is excluded (individuals would purchase grinders), the 1973 wet system costs to the public sector would be on the order of $30-$90. (Bell-Cornell)

REMOVAL OF ALGAE FROM WASTE STABILIZATION POND EFFLUENT,
Mississippi State Univ., Mississippi State Dept. of Civil Engineering.
M. T. Bond.
Available from the National Technical Information Service, Springfield, Va., 22161 as PB-256 512 $4.50 in paper copy, $3.00 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Completion Report July 1976. 56 p, 19 fig, 6 tab, 22 ref, 4 append. OWRT A-096-MISS(1).

Descriptors: Ponds, Lagoons, Waste treatment, *Algae, *Oxidation lagoons, Effluents, Sludge Polyelectrolytes, *Waste water treatment, Kinetics.
Identifiers: *Alum treatment.

The objectives were: (1) To determine the variances of selected parameters for waste stabilization pond effluents treated with alum alone and with alum used with polyelectrolytes and (2) To determine the sludge volume and characteristics produced in the physical-chemical process. In addition, the use of lime in place of alum was studied. Effluents were collected for four sampling conditions and treated in the laboratory to determine chemical requirements and sludge characteristics. Alum requirements were in the range of 60 to 100 mg/l while lime (Ca(OH)2) requirements varied from 250 to 600 mg/l. Various polyelectrolytes were tried and produced fair results when cationic polymers were used in concentrations greater than 15 mg/l. The results from chemical-polymer systems were only a little better than those using chemicals only. An equation has been proposed that relates alum sludge volume produced to suspended solids removed. The sludge was found to separate rapidly and to be thickened to a significant degree by gravity. Results of the traditional specific resistance to filtration and the filter leaf tests indicate that vacuum filtration of the sludge would not be effective. A possible exception may be precoat filtration of lime sludge.

INHIBITION OF NITRIFICATION BY AMMONIA AND NITROUS ACID,
Monteco Environmental Management Associates, Montgomery, N.Y.
A. C. Anthonisen, R. C. Loehr, T. B. S. Prakasam, and E. G. Srinath.
Journal Water Pollution Control Federation, Vol. 48, No. 5, p 835-852, May, 1976. 15 fig, 4 tab, 24 ref.

Descriptors: *Nitrification, *Inhibitors, *Inhibition, *Ammonia, *Nitrogen fixing bacteria, Waste treatment, Temperature, Microorganisms, Municipal wastes, Industrial wastes, Farm wastes, Soils, Fertilizers, Chemical reactions, *Waste water treatment, Nitrites.
Identifiers: *Nitrous acid, Nitrifiers.

The inhibitory effects of ammonia and nitrous acid on nitrification, a process which may occur during waste treatment, were investigated. Nitrification inhibition was correlated with free ammonia and free nitrous acid concentrations but not with total ammonia or nitrite ion concentrations. The free ammonia concentrations required for the inhibition of nitrosomonads and nitrobacters were 10-150 mg/liter and 0.1-1.0 mg/liter, respectively. Inhibition of nitrifying organisms by free nitrous acid was initiated at concentrations between 0.22 and 2.8 mg/liter. Factors affecting the inhibition of nitrification by free ammonia and free nitrous acid included acclimation of the nitrifiers to the inhibitors, temperature, and the number of active nitrifying organisms. Free ammonia and free nitrous acid inhibition of nitrification occurs in municipal, industrial, and agricultural wastes as well as with fertilizers in the soil. (Kreager-FIRL)

AWT ENERGY NEEDS A PRIME CONCERN,
Orange County Water District, Fountain Valley, Calif. Board of Directors.
D. G. Argo, and G. M. Wesner.
Water and Wastes Engineering, Vol. 13, No. 5, p 24-26, 77, May, 1976. 2 fig, 1 tab.

Descriptors: *Waste water treatment, *Tertiary treatment, *Treatment facilities, *Energy budget, Adsorption, Filtration, Chlorination, Pumps, Equipment, Reverse osmosis, Facilities, Recycling, *Treatment facilities, Desalination.

Primary and secondary energy requirements are outlined for an advanced design waste water treatment plant designed to treat 15 million gallons/day of trickling filtered secondary effluent by chemical clarification with lime, ammonia stripping, recarbonation, mix-media, filtration, carbon adsorption, and chlorination. Energy consumptions for the influent pump station, the chemical clarification system, ammonia removal towers, the recarbonation basin, the filtration system, activated carbon adsorption, and chlorination are 2688, 842, 27,988, 4370, 412, 3566, and 91 kilowatt-hours/day, respectively. A reverse osmosis system is being installed to demineralize one-third of the plant's flow and is expected to consume about 35,000 kilowatt-hours/day. Detailed diagrams of the reclamation plant and the reverse osmosis section are presented. (Kreager-FIRL)
W76-11198

THE SIGNIFICANCE OF PORE DIFFUSION TO FILTER DENITRIFICATION,
Technical Univ. of Denmark, Lyngby. Dept. of Sanitary Engineering.
P. Harremoes.
Journal Water Pollution Control Federation, Vol. 48, No. 2, p 377-388, February, 1976. 9 fig, 1 tab, 15 ref.

Descriptors: *Denitrification, *Filters, *Design criteria, *Mathematical models, *Kinetics, Waste treatment, Chemical reactions, Physical properties, Biological treatment, Pores, Diffusion, Waste water treatment, Filtration.
Identifiers: *Filter denitrification.

The kinetics of filter denitrification are reviewed and a mathematical expression relating pore diffu sion to filter denitrification is developed. An ex pression for a bulk half-order reaction based o zero-order heterogeneous reactions in a por which is only partly penetrated by the substrate i found to be suitable for simulating filter denitrifi cation. The applicability of the theory is demon strated by a comparison with filter concentratio profiles and with the half-order bulk reaction rat per unit filter surface. Values of the half-orde bulk reaction rate ranging over 4 orders of mag nitude are demonstrated for differences in medi type and size, porosity, specific surface, residen time, scale of experiment, and temperature. Th design of denitrification filters with respect to cho ice of media and residence time is shown possib by selection of the proper reaction rate. (Kreage FIRL)

RESPONSE OF ACTIVATED SLUDGE T QUANTITATIVE SHOCK LOADING,
Weston (Roy F.), Inc., Wilmette, Ill.
P. Krishnan, and A. F. Gaudy, Jr.
Journal Water Pollution Control Federation, V 48, No. 5, p 906-919, May, 1976. 9 fig, 3 tab, 16 r

Descriptors: *Activated sludge, *Waste wa treatment, *Feeding rates, Performance, Eval tion, Treatment facilities, Equipment, Treatme Organic loading.
Identifiers: Quantitative shock loading, Substr leakage.

The effect of quantitative shock loading, ministered as a step increase in feed concent tion, on both once-through and cell recycle tivated sludge systems was investigated for v ous hydraulic reactor detention times. As the tention time was increased, there was generally improvement in system response with regard the amount of substrate leakage during transient phase at a given shock concentration substrate. This trend was most readily observe the once-through systems, although it was seen in the cell recycle systems at high sh levels. Cell recycle operation appeared to h some beneficial effect with regard to transient strate leakage at the 3000 mg/liter level; howe a 5000 mg/liter shock level exceeded the abilit the cell recycle program to attenuate subst leakage over that observed in the once-thro system. The results indicate that activated slu systems may be expected to accommodate a 2 increase in feed concentration with little or no strate leakage in the transient phase. (Krea FIRL)

Identifiers: *Settling tanks.

npirical parameters which have been found use-
l in the past for describing the performance of
al settling tanks in activated sludge processes
e evaluated in light of current knowledge on the
bject. Stipulation of some maximum overflow
e and minimum retention time seems reasona-
, but only for a description of the clarification
ıction of the tank. These parameters completely
regard the thickening function of the tank. The
e of sludge volume index as a basis for estimat-
the concentration of return sludge to be ex-
cted from a final settling tank appears
estionable because it does not take into account
designer's and the operator's ability to alter the
formance of final settling tanks to achieve a
ge of return sludge concentrations. The con-
t that solids retention time must be minimized
final sedimentation tanks does not seem well
nded except as it relates to the possible flota-
of sludge caused by denitrification and to the
ase of phosphorus from sludges. The popular
that overflow rates in final sedimentation
cs should be selected to be equivalent to the
ling velocity of the mixed liquor is theoretically
rrect and may result in inaccurate sedimenta-
tank design. (Kreager-FIRL)

terature search and laboratory experiments
performed to evaluate the relative merits of
versus two-stage nitrification in activated
ge processes. Both one- and two-stage
ms were found capable of achieving complete
ication and a high level of carbon removal.
operational difference between the two
esses was simply the value of the limiting
cell residence time or growth rate. The limit-
ean cell residence time for complete nitrifica-
vas six days for the two-stage process and ten
for the one-stage process. The one-stage
ss appears to offer some advantages if sludge
sal presents a difficult or costly problem and
requires one clarifier. However, nitrification
be possible in a two-stage process when it is
ossible in a one-stage system. A problem en-
ered in both the one- and two-stage
sses is pH reduction by the production of
acid. If insufficient alkalinity is present in
vaste water, the one-stage system and the
cation reactor of the two-stage system will
e pH adjustment. (Kreager-FIRL)

asibility of using aerobic thermophilic treat-
modification of the conventional activated
sludge process, for purifying waste waters with high concentrations of organic matter was evaluated using a single-stage, isothermal, completely mixed, continuous-flow reaction system. The thermophilic system proved capable of treating waste water with a high organic content in less time than that required for mesophilic systems and produced less sludge. Over 90% removal of soluble chemical oxygen demand was observed with a sludge retention time of 2 days. The percentage removal of chemical oxygen demand increased with increasing sludge retention times. The theoretical air requirements for thermophilic systems are expected to be slightly higher (14%) than for mesophilic systems because of the higher rate of endogenous respiration at elevated temperatures. EQUIPMENT APPLICATIONS IN WASTEWATER TREATMENT CLARIFIERS,
FMC Corp., Itasca, Ill. Environmental Equipment Div.
J. C. Lodholz, and H. Pentz.
Public Works, Vol. 107, No. 6, p 97-100, June, 1976. 4 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Mechanical equipment, *Separation techniques, *Settling basins, Flotation, Sludge, Scum.
Identifiers: *Clarifiers.

Gravity separation in primary and secondary clarifiers is generally confined to settling tanks except where industrial wastes susceptible to flotation are present. The chain and flight collector, most commonly used in primary clarifiers, consists of two strands of chain carrying flights at about 10 ft intervals and removes both sludge and scum. Rectangular basins may also be equipped with a travelling bridge, which traverses the length of the basin and carries a scraper blade along the bottom to collect sludge and, on the return run, along the surface for skimming. Collection mechanism for circular tanks have rotating skimming blades for scum and rotating scraper blades for sludge. Primary sludge collectors with skimmers also require discharge devices, which may be operated manually or automatically, periodically or continuously. A stirring mechanism is required if flocculants are used; separate chambers or the same chamber may be used for mixing and flocculation. Tube settlers are used in advanced waste treatment; sludge normally leaves them by gravity. The frequency of sludge withdrawal and scum removal vary for different plants, but a schedule can be established for a particular plant. Mechanical parts of skimmers and sludge collectors should be checked regularly to determine whether maintenance is required. (Snyder-FIRL)

LAND TREATMENT OF MUNICIPAL WASTEWATER,
Metcalf and Eddy, Inc., Palo Alto, Calif.
R. W. Crites, and C. E. Pound.
Environmental Science and Technology, Vol. 10, No. 6, p 548-551, June, 1976. 1 fig, 2 tab, 6 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Land use, Effluents, Tertiary treatment, Costs, *Infiltration rates, Soils, Irrigation, Water quality, Water management(Applied), *Overland flow.
Identifiers: *Rapid infiltration.

Land treatment and advanced treatment of waste water are economically competitive in many cases and produce effluents of generally comparable quality. The three major types of land treatment, slow-rate, rapid infiltration, and overland flow, are compared. Land treatment removes organics, nitrogen, and some phosphorus, but exchangeable cations and trace elements can cause problems in some soils. In certain cases, municipal waste water should be treated before land application. For a given type of land treatment, the quality of the effluent that can be attained is nearly the same whether untreated, primary, or secondary waste water is applied. Bakersfield, California; Tallahassee, Florida; and San Angelo, Texas all use slow-rate land application to irrigate cropland. Rapid infiltration of waste water that has received secondary treatment is used in Lake George, New York, and Phoenix, Arizona. Overland flow of treated waste water is used in Ada, Oklahoma, and Melbourne, Australia. The costs of land treatment can compare favorably with those of conventional treatment and discharge systems. With proper management and monitoring, land treatment can compete with advanced waste water treatment in many locations in terms of renovated water quality and water and nutrient resource management. (Snyder-FIRL)
W76-11207

COMPARATIVE EFFECTS OF CHEMICAL PRETREATMENT ON CARBON ADSORPTION,
Municipal Environmental Research Laboratory. Cincinnati, Ohio.
J. J. Westrick, and J. M. Cohen.
Journal Water Pollution Control Federation, Vol. 48, No. 2, p 323-338, February, 1976. 18 fig, 4 tab, 18 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Adsorption, *Activated carbon, *Pilot plants, Filtration, Effluents, Phosphorus, Organic matter, Suspended solids, Pre-treatment(Water).
Identifiers: Physico-chemical treatment, *Chemical pre-treatment.

Three physico-chemical pilot plants were operated for a period of nearly 11 mo with three distinctly different chemical clarification schemes preceding identical granular activated carbon and filtration systems. All produced effluents with low concentrations of phosphorus, organics, and solids. A data analysis method was developed that permits simplistically comparing carbon dosages required for given effluent qualities. Superior organic removal was provided by the iron coagulant in clarification-filtration pretreatment, yielding the lowest estimated cost for a carbon system to produce any effluent quality studied. These estimates include only the carbon process, with regeneration, and exclude other total system costs. These results obviously are specific to the waste type and conditions of operation. Although small differences in performance were observed for the three systems, all produced effluents in essentially the same range of quality. (Snyder-FIRL)

INDUSTRIAL WASTES MEET DOMESTIC SEWAGE.
American City and County, Vol. 91, No. 6, p 71-72, June, 1976. 2 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Municipal wastes, *Aeration, Biological treatment, Oxidation lagoons, Biochemical oxygen demand, Odor, Foaming, Chlorination.

The construction of a combined secondary treatment plant to handle municipal primary wastes from the city of Grand Rapids, Michigan and industrial wastes from a paper mill is described. The treatment plant is an extended aeration type. Following primary treatment, overflow from the domestic and industrial primary clarifiers is combined and pumped to the secondary plant through a 36-inch force main. Two 'A' lagoons receive the primary effluent and waste activated sludge. These 'A' lagoons operate in a complete-mix mode with a 29-hour detention time and are designed to remove from 55-90% of the influent biochemical oxygen demand. Effluent from the 'A' lagoon goes to two clarifiers where sludge is settled out for return to the lagoons or for pumping to the primary plant for dewatering. Clarifier effluent flows to two 'B' lagoons for further aeration with a 30-hour detention time to complete the biochemical oxygen demand removal. The liquor then flows to two 'C' lagoons for chlorination and final settling prior to discharge to the river. The city owns the facility, and the paper mill pays for service based on a metered flow pro-rated share. Problems being experienced with the facility include odor and foam control which are expected to be solved with additives and minor repairs. (Kreager-FIRL)

OZONE PROVIDES ALTERNATIVE FOR SECONDARY EFFLUENT DISINFECTION PART 3,
Welsbach Ozone Systems Corp., Philadelphia, Pa.
C. Nebel, R. D. Gottschling, P. C. Unangst, H. J. O'Neill, and G. V. Zintel.
Water and Sewage Works, Vol. 123, No. 6, p 81-83, June, 1976. 4 fig, 41 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Ozone, *Sewage effluents, *Disinfection, Chlorine, Hydrogen ion concentration, Oxidation, Detergents, Organic compounds, Tertiary treatment.

The conclusion of a three-part article on ozone in secondary effluent disinfection deals with ozone as a serious alternative to chlorine. At the Blue Plains Treatment plant in Washington, D. C., it has been demonstrated that ozonolysis always shifts the pH toward neutrality. Ozone has also been shown to oxidize all naturally occurring cyanides in a secondary effluent and to eliminate ABS and LAS detergents. Ozone also reduces or eliminates organic pesticides from sewage effluent. It was concluded that ozonization of secondary effluent is an effective disinfection method, with tertiary treatment obtainable at no extra cost. Additionally, an ozone-induced frothing process is capable of removing significant amounts of dissolved and suspended matter via oxidation and physical separation by flotation. ACID TREATED CATIONIC STARCH IN THE FLOCCULATION AND DEWATERING OF SLUDGE,
W. G. Hunt, and R. J. Belz.
United States Patent 3,962,079. Issued June 8, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 2, p 754, June, 1976

Descriptors: *Patents, *Sludge treatment, *Flocculation, *Dewatering, Municipal wastes, Cations, Waste treatment.
Identifiers: Starches

A patent for a process to flocculate and dewater municipal raw primary sludge is presented. The process involves adding between 0.007-0.200% (based in dry weight of the sludge) of an acid treated gelatinized cationic starch ether of amine butene halide to the sludge. The degree of amine butene halide substitution in the reagent is between 0.15 and 0.25, and the reagent fluidity ranges between 30-50 ml. The sludge is then dewatered to approximately below 70% moisture. (Kreager-FIRL)

PROCESS FOR CONVERTING AQUEOUS SEWAGE TO POTABLE WATER,
Texaco Inc., New York. (Assignee).
H. V. Hess, W. F. Franz, and E. L. Cole.
United States Patent 3,962,076. Issued June 8, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 2, p 752-753, June, 1976. 1 fig.

Descriptors: *Sewage treatment, *Water reuse, *Potable water, *Water purification, *Patents, Organic compounds, Mineral water, Brines, Sludge, Byproducts, Separation techniques, *Waste water treatment.

A patent for a process to convert aqueous sewage containing dissolved brine-forming minerals and organic compounds to potable water and coke is described. The process involves the following steps: separating the sewage into a primary sludge and a relatively cool primary effluent containing the dissolved minerals; passing the effluent into direct counter-current contact with relatively hot hydrocarbon liquid under a pressure of 1000-3000 lbs/sq. in. and at a temperature of between 600 and 700 F, thereby forming a hydrocarbon minerals-free water solution, a cooled hydrocarbon, and a hot concentrated minerals-containing brine solution; separting the hydrocarbon from the water; flashing at least a part of the water; condensing the water for potable use; pressurizing the sludge to around 1000-3000 lbs/sq in.; and injecting the hot brine into the sludge in order to coke the sludge in the liquid phase and form a reject coker effluent, gases, and coke. (Kreager-FIRL)

SYSTEM FOR TREATING SLUDGE,
Inoue-Japan Research, Inc., Yokohama (Japan). (Assignee).
K. Inoue, and A. Shimizu.
United States Patent 3,962,069. Issued June 8, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 2, p 750, June, 1976. 1 fig.

Descriptors: *Patents, *Sludge treatment, *Electrochemistry, *Dewatering, Waste treatment, Equipment, Electrodes.

A patent for a device which treats sludge is described. The apparatus consists of the following components: a vessel for receiving a bath of the sludge, an electrically conductive member with a screen-like perforated surface that is continuously displaceable through and outside of the bath along a predetermined path to form a first electrode, a second electrode juxtaposed with the first electrode in the bath, a power supply for applying an electric potential across the two electrodes to electrochemically effect a flow of water from the sludge through the electrode perforations on which the sludge deposits, a means for removing the sludge deposits from the perforated surface, a means for detecting the water content of the sludge deposit, and a means for controlling the electrical potential of the apparatus so that a desired water content of the sludge deposit can be maintained (Kreager-FIRL)
W76-11216

PROCESS FOR TREATING WASTE WATER,
Air Products and Chemicals, Inc., Allentown, Pa. (Assignee).
K. Wyatt
United States Patent 3,960,717. Issued June 1, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 1, p 305, June, 1976. 1 fig

Descriptors: *Patents, *Waste water treatment, *Activated sludge, *Aeration, *Organic compounds, *Nitrogen, Gases, Oxygen, Biological treatment, Separation techniques, Recycling

A patent for an activated sludge process designed to treat waste water containing organic matter and dissolved nitrogen gas is described. The waste water is first pretreated in an enclosed zone by contact with an oxygen enriched stripping gas having an oxygen content in excess of that of air and a nitrogen partial pressure less than that of air. At least 25% (by weight) of the dissolved nitrogen gas is stripped from the waste water and vented from the pretreatment chamber. The pretreated waste water is then introduced along with recirculated activated sludge into an enclosed aeration zone where an oxygen enriched aeration gas is also introduced. Biological degradation of the organic matter in the waste water occurs in this enclosed mixed liquor aeration zone. The mixed liquor is then discharged from the aeration zone, with the activated sludge being separated from the liquor and recirculated back to the aeration zone. The oxygen enriched stripping gas used in the pretreatment stage consists of at least some oxygen enriched aeration gas withdrawn from the mixed liquor aeration zone of the apparatus. (Kreager-FIRL)

METHOD OF PROCESSING REFUSE AND/OR SLUDGE AND A PLANT FOR CARRYING OUT THE METHOD,
J. R. Kaelin.
United States Patent 3,960,537. Issued June 1, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 1, p 255-256, June, 1976. 1 fig.

Descriptors: *Patents, *sludge treatment, *Solid wastes, *Waste treatment, *Byproducts, *Biological treatment, Equipment, Design criteria, Fertilizers, Organic compounds, Treatment facilities.
Identifiers: Compost.

A patent for a biological conversion process and apparatus designed to form compost from refuse or thickened sludge is described. The material to be treated is placed into the top of a continuous treatment chamber where it is permeated with a gas mixture delivered under elevated pressure by several gas distributor blades in the chamber. The distributor blades are rotated about an axis which is parallel to the direction in which the material to be treated passes. The gas mixture is exhausted by means of suction outlets which are associated with each gas distributor blade and are located in the side wall of the treatment chamber. The treated material is discharged at the bottom of the treatment chamber. (Kreager-FIRL)

INTEGRAL CIRCULAR WASTEWATER TREATMENT PROCESS,
Union Carbide Corp., New York. (Assignee).
L. M. La Clair, J. R. McWhirter, and W. L. Ross.
United States Patent 3,963,609. Issued June 15, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 3, p 1261, June 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Biochemical oxygen demand, *Aeration, *Activated sludge, Biological treatment, Design criteria, Oxidation, Recycling, Oxygen, Separation techniques.

A patent for a process to reduce the biochemical oxygen demand of waste water is described. The process involves aeration with at least 50% oxygen in the presence of recycled activated sludge to achieve biological oxidation and biochemical oxygen demand reduction. The oxygen feed gas, waste water, and activated sludge are mixed in a first aeration zone wherein a fluid is simultaneously recirculated; and the partially oxygenated liquor as well as the gas which is partially depleted of oxygen are then separately introduced into a second aeration zone for continuous mixing and fluid recirculation. The further oxygenated liquor from the final aeration zone which has a reduced biochemical oxygen demand is separated into effluent water and activated sludge in a clarification zone, with at least part of the sludge being returned to the first aeration zone for recycling. PROCEEDINGS OF THE SOUTHEASTERN CONFERENCE ON WATER SUPPLY AND WASTEWATER IN COASTAL AREAS,
North Carolina Water Resources Research Inst., Raleigh.
Held at Wrightsville Beach, N. C., April 2-4, 1975, 187 p. Edited by James M. Stewart. $10.00.

Descriptors: *Southeast U. S., *Waste disposal, *Water supply, Waste water disposal, Waste disposal wells, Groundwater resources, Waste water treatment, *Alternative planning, Land management, *Coastal plains, Marine biology, Financing, Financial feasibility, Water reuse, Institutions, Estuarine environment, Reviews, Ecology.
Identifiers: *Ocean outfalls, Coastal areas, Land application, Public participation, Marine environment, Treatment alternatives.

Among the most valuable resources of the Southeastern United States are its coastal lands and waters. The coastal areas, and in particular their estuaries, are among the most biologically productive regions of the nation, spawning major sports and commercial fisheries. The extremely high recreational and esthetic values of coastal lands and waters carry the seeds of their own destruction through their attractiveness for economic development. This Conference with 17 major presentations was conducted to review the State of the Art of proper planning and management of water supply and wastewater disposal is coastal areas. Special attention was paid to defining technological and institutional alternatives, their relation to land use planning and environmental protection, and to identifying those water and wastewater problems of significance in coastal areas. The Conference was sponsored by the Coastal Plains Center for Marine Development Services, Coastal Plains Regional Commission, Water Resources Research Institute of The University of North Carolina, and the University of North Carolina Sea Grant Program. WATER SUPPLY AND WASTEWATER DISPOSAL - PLANNING AND PROBLEMS - IN COASTAL AREAS,
Oesen (Henry von) and Associates, Inc., Wilmington, N. C.
P. S. Denison.
In: Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas, April 2-4, 1975, Wilmington, North Carolina, University of North Carolina, p 7-11.

Descriptors: *Water supply, *Waste water treatment, *Domestic wastes, *Sewerage, *Waste water disposal, *Coasts, *Outlets, Atlantic Ocean, Atlantic coastal plain, *North Carolina, Planning, Programs, Oceans, Treatment, Sewage treatment, Estuarine environment, Estuaries.
Identifiers: Regional planning.

A review of water supply and waste water disposal problems in coastal areas of the United States is presented, with particular emphasis on the North Carolina area. Limited local groundwater supplies in beach communities of North Carolina are diminishing such that plans are underway to augment these supplies with additional potable water transported from more productive mainland areas. Discharges of domestic sewerage wastes into the coastal soils are beginning to adversely affect fragile estuarine waters; the most viable solution to the problem appears to be the collection and treatment of such wastes, followed by disposal of the effluent residual into the Atlantic Ocean via outfalls. Local and regional water supply and waste water treatment planning programs throughout North Carolina are outlined. (See also W76-11224) (Kreager-FIRL)

OCEAN OUTFALL DISPOSAL SYSTEMS,
Engineering-Science, Inc., Berkeley, Calif.
D. L. Feuerstein.
In: Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas, April 2-4, 1975, Wilmington, North Carolina, University of North Carolina, p 12-26, 2 fig, 1 tab.

Descriptors: *Waste water disposal, *Waste water treatment, *Coasts, *Waste dilution, *Atlantic Ocean, *Outlets, *Mathematical models, *Dispersion, *Diffusion, Design criteria, Disposal, Treatment, Feasibility, Cost-benefit analysis, Evaluation.
Identifiers: *Ocean outfalls.

A theoretical examination of mechanisms affecting the diminution of waste water constituents discharged from ocean outfalls is presented along with an evaluation of the efficacy of submarine outfall disposal systems for East Coast conditions. Mathematical expressions are derived for predicting the initial dilution occurring in the immediate vicinity of a diffuser, subsequent dilution resulting from lateral dispersion, and diminution caused by the disappearance or decay of non-conservative waste water constituents. Proper diffuser design is shown to be capable of effecting dilutions on the order of 50 to 100 in the initial mixing zone. The use of waste water treatment facilities in conjunction with outfall discharge is also considered, and it is shown that increasing treatment levels can be matched with decreasing dilution capacities of disposal facilities to satisfy the same receiving water quality objectives. Submarine outfall disposal systems on the East Coast appear to be cost-effective and are recommended for evaluation. (See also W76-11224) (Kreager-FIRL)

THE ROLE OF CONVENTIONAL WASTEWATER TREATMENT IN COASTAL AREAS,
North Carolina Univ. at Chapel Hill. Wastewater Research Center.
J. C. Brown.
In: Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas, April 2-4, 1975, Wilmington, North Carolina, University of North Carolina, p 75-86. 1 tab, 8 ref.

Descriptors: *Waste water treatment, *Waste water disposal, *Coasts, *Treatment facilities, Oceans, Outlets, Nitrogen, Phosphorus, Evaluation, Water quality control, Water spreading, Pretreatment(Water).

An evaluation of the role of conventional waste water treatment in coastal area water quality management is presented. Secondary treatment appears to be sufficient for maintaining current water quality standards, and additional processes can be added to conventional treatment plants for the removal of nitrogen or phosphorus as nutrient discharge limitations are developed in the future. When removal of nutrients is not technically or economically feasible at a treatment plant, conventional secondary treatment can serve as a pretreatment for ultimate disposal by land-spreading methods. Ocean outfalls offer the most environmentally and ecologically attractive solution for permanent and resort communities located close to the ocean, with conventional treatment methods serving as pre-treatment for ultimate disposal in the ocean. LAND APPLICATION RESEARCH AT ROBERT S. KERR ENVIRONMENTAL RESEARCH LABORATORY,
Robert S. Kerr Environmental Research Laboratory. Ada, Okla.
R. E. Thomas, and C. C. Harlin, Jr.
In: Land Application of Wastewater, November 20-21, 1974, Newark, Delaware, p 3-12. 22 ref.

Descriptors: *Waste water treatment, *Waste water disposal, *Percolation, *Infiltration, *Irrigation, *Overland flow, Research priorities, Programs, Groundwater, Lakes, Municipal wastes, Denitrification, Biodegradation, Organic compounds, Sewage treatment, Phosphorus.
Identifiers: Land application.

Research being conducted by the Robert S. Kerr Environmental Research Laboratory for the Environmental Protection Agency to evaluate various methods of waste water management which incorporate land application are outlined. Crop irrigation is being investigated in terms of locating and evaluating currently available quantitative information on application rates, crop responses, soil changes, and groundwater quality changes. Projects designed to demonstrate crop irrigation approaches in geographic areas where historical information is scarce are also being conducted. Infiltration-percolation investigations include four studies in water-short southwestern states and two studies in water-rich north central states. Th studies involve assessing the effectiveness of infiltration approach for direct recharge of a p ble groundwater supply with secondary effl evaluating the use of infiltration-percolation rendering municipal effluent suitable for f and maintaining the water level of recreati lakes, and evaluating existing infiltration-perc tion facilities. Projects designed to assess feasibility of treating raw sewage by overland are also being conducted in addition to research on phosphorus retention in denitrification, biodegradation of organics, climatology. The results of experiments involving the sp rigation of cropland and forested area treated municipal sewage effluent are pre Combinations of agronomic and forested ar pear to provide the greatest flexibility fo recycling operations. Such systems are adaptable to small cities and suburbs than metropolitan areas because of the availab open land close to the waste water treatme in the former case. However, the lan requirement is not a major prohibitive fac the recommended level of irrigation (5 cm only 52 hectares of land is required for the of 4 million liters of waste water/day. metropolitan areas may be able to utilize go ses, playing fields, forest preserves and greenbelts, scenic parkways, and perhaps vided highway and beltway medial strips fo

ter disposal. The experimental results also in-
ate that municipal waste water might be used to
laim and revegetate many of the barren bitu-
ious strip mined spoil banks and anthracite
ise banks existing throughout the Appalachian
ion and restore them to a more esthetic and
ductive state. (See also W76-11231) (Kreager-

use of overland flow for the treatment and
osal of waste water is discussed in terms of its
retical basis and system operation. In an over-
flow system, the waste water is applied at the
f gentle sloping hills and is allowed to flow
the soil surface down to collection channels.
treatment is represented by an intimate in-
tion among the soil surface layer, surface or-
mat, plants, and microorganisms. The com-
length of the slope is 100-300 ft, and normally
ystem is employed on slopes ranging from 2-
Application rates are low, generally less than
cre-in/day; waste water, however, is applied
days/week so that the weekly application rate
out 2.5 acre-in. The ability to monitor waste
as it leaves the treatment site is an especially
ble characteristic of overland flow systems.
of the treated waste water is available at cen-
ollection channels for quality determinations
or discharge or other uses. The cost of over-
low systems is about $2000/acre. (See also

e of infiltration-percolation systems for the
ent and disposal of waste water is
ed. The waste water in infiltration-percola-
stems is applied at much higher rates (0.3-
week) than with low-rate or irrigation-type
s, resulting in the obvious advantage of low
equirements (1-10% of that for low-rate
s). High-rate systems require relatively
ble soil such as sandy loams to medium
The transmissibility of the underlying
should also be sufficiently high to conduct
er laterally away from the infiltration area
undue water table rises. Another ad-
of high-rate systems is that the infiltration
e much higher than the evapotranspiration
cause of the high hydraulic loading rates in
e systems, the amounts of nitrogen,
orus, and other elements entering the
with the waste water are much higher than
an remove. Thus, special management
ues are required to stimulate dentrification
te and immobilization of phosphate in the
soil to yield renovated water of acceptable quality. It may be desirable to restrict the spread of the renovated water into the groundwater basin by selecting the infiltration site so that the renovated water drains into surface water. (See also W76-11231) (Kreager-FIRL)

LAND APPLICATION OF TREATED SEWAGE IN THE MOUNTAIN STATE,
Campaign Clean Water, Charleston, W.Va.
E. Light.
In: Land Application of Wastewater, November 20-21, 1974, Newark, Delaware, p 93-94. 7 ref.

Descriptors: *Sewage treatment, *Sewage disposal, *Municipal wastes, *Overland flow, *Irrigation, *West Virginia, Soils, Topography, Climates, Land reclamation, Mountains, Application rates, Feasibility, *Waste water treatment.
Identifiers: *Land application.

The feasibility of using land application techniques (overland flow, spray irrigation) for the treatment of municipal sewage wastes in the state of West Virginia is discussed. Objections to land treatment in the state because of the topography, climate, and soil of the Appalacian Mountains are cited as being invalid based on the success of land application techniques in other areas of the country with similar problems. About one-third of the soil scattered throughout the Appalachians is estimated to be suitable for land treatment. Erosion is not expected to be a problem in West Virginia if application rates are not too high since the state is heavily forested. The state's strip mines and coal refuse piles are considered prime land treatment sites. Since 70 cities in West Virginia will be required to go to advanced treatment, land application of municipal wastes is proposed as a feasible alternative that is economically realistic. A NEW CONCEPT IN SMALL WATER SYSTEMS,
MacLaren (James F.) Ltd., Toronto (Ontario).
G. A. Aldworth.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 228-248. 12 fig, 1 tab.

Descriptors: *Water supply, *Sewage treatment, *Design criteria, Topography, Climates, *Freezing, *Waste water treatment, Treatment facilities, Equipment, Materials, Insulation, Costs, *Water treatment, Temperature.

Design criteria associated with the development of special water supply and sewage treatment systems subject to geographical and climatic constraints are outlined. Three particular projects are described: the development of an air-transportable above-ground water and sewage treatment system suitable for ambient temperatures between -25 and +125 F, the upgrading of existing water supply systems in Northern Newfoundland and Southern Labrador to render them less susceptible to freeze-up, and the development of a full-scale shallow-buried water and sewage system in very rocky terrain. Detailed information on special equipment used (plastic piping, water heaters, pipe insulation, pipe frost covers, bleeders, mobile fire pumps) and the costs involved is provided along with diagrams of each installation. W76-11257

SYMBIOSIS MAKES COMPLETE WATER REUSE PRACTICAL,
L. K. Cecil.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 12-14.

Descriptors: *Water reuse, *Recycling, *Municipal wastes, *Farm wastes, *Industrial wastes, Byproducts, Planning, Pollutants, Sewage, Urban runoff, *Waste water treatment, *Symbiosis.
Identifiers: Municipal-industrial wastes.

The establishment of a symbiotic relationship between municipal, industrial, and agricultural activities in an area is proposed as a means to achieve complete water reuse. Sewage and surface runoff from a city can be utilized by industries which are properly situated adjacent the city for heat dissipation requirements. Garbage can be fractionated into burnable compounds for the production of heat energy, with the unburnable fractions being converted into marketable forms. Industries can also utilize agricultural wastes for beneficial purposes if farms are properly located around a city. Waste water from industry, in turn, can be utilized by agriculture if farms are located within a reasonable distance of industrial complexes. Thus, by proper collaboration of cities, industries, and farms, the goal of zero discharge of pollutants into the aqueous environment can be approached. (See also W76-11257) (Kreager-FIRL)

UNIV. OF ILL. URBANA-CHAMPAIGN

ment(Applied), Irrigation, Infiltration, Percolation, Saline water intrusion, Industrial water, Groundwater recharge, Research and development, Programs, Organizations.

Activities concerning the reuse of waste water in Puerto Rico are reviewed. The Ponce Regional Water Resources Management Study, which is a cooperative effort between the Puerto Rican government and the U. S. Army Corps of Engineers, is concentrating on waste water management, water supply management, flood control, conservation of fish and wildlife, and recreation, with emphasis being given to water supply. The study covers 14 municipalities over an area of 734 sq mi and is evaluating the following reuse alternatives: the use of secondary treated effluent from water treatment plants for irrigation, infiltration, and percolation; the use of waste water for industrial purposes; and the use of waste water to prevent salt water intrusion. The Corps of Engineers is also conducting an island-wide water supply study with the Puerto Rico Department of Natural Resources. The U. S. Geological Survey has initiated a research project in Fort Allen, Salinas, Puerto Rico dealing with the use of secondary effluent for groundwater recharge. (See also W76-11257) (Kreager-FIRL)

REMOVAL AND RECOVERY OF AMMONIA FROM ANAEROBIC DIGESTER SUPERNATANT,
CH2M/Hill, Redding, Calif.
R. W. Prettyman, and L. G. Kepple.
In: 3rd National Conference on Complete WateRuse, June 27-30, 1976, Cincinnati, Ohio, p 95-99. 7 fig, 2 tab, 3 ref.

Descriptors: *Waste water treatment, *Byproducts, *Anaerobic digestion, *Ammonia, Fertilizers, Water reuse, Recycling, Water reclamation, Effluents, Industrial water, Nitrogen, Phosphorus, Absorption, Aeration, Flocculation, Chemical precipitation, Organic acids, Sulfates.
Identifiers: Stripping.

An ammonia removal and recovery process for rendering anaerobic digester supernatant suitable for industrial reuse is described. The supernatant is first aerated to strip excess carbon dioxide so that lime requirements are kept minimal. Lime is then added to precipitate phosphorus, flocculate organic matter, and obtain a pH of 11 for stripping ammonia nitrogen. The ammonia removal and recovery process employs an ammonia stripping unit and an ammonia absorption unit and produces ammonia in the form of a common fertilizer such as ammonium sulfate which can be sold as byproduct. In the stripping unit, the high pH influent stream flows down over packing material, and the recirculating air stream passes upward and carries the ammonia gas-laden air to the absorption unit. The stripping unit effluent which is relatively low in ammonia nitrogen is discharged from the bottom of the unit. Ammonia-laden air contacts an acidic absorbent liquid in the absorber unit, with ammonia gas being dissolved in the absorbent liquid and converted to ammonium ions. If sulfuric acid is added, for example, an ammonium sulfate solution is formed. (See also W76-11257) (Kreager-FIRL)

UNION CARBIDE'S REUSE OF SEWAGE WATER,
Carbide Chemicals Co., Bombay, India.
R. N. Banerji.
In: 3rd National Conference on Complete Water Reuse, June 27-30, 1976, Cincinnati, Ohio, p 161-165. 1 fig, 4 tab.

Descriptors: *Sewage treatment, *Water reuse, *Water reclamation, *Symbiosis, *Industrial water, Biological treatment, Activated sludge, Aeration, Flocculation, Filtration, Water softening, Chlorination, Costs, Demineralization, Sewage, Waste water treatment

A system for processing municipal sewage water and reusing it for industrial operations at Union Carbide's Chemicals and Plastics plant at Bombay, India is described. The sewage treatment system involves: raw water pumping and conveying, detritus matter removal, biological treatment (activated sludge) with extended aeration, clarification, chemical dosing, flocculation, sand filtration, softening, post chlorination, and demineralization. In order to make the treated water fit for industrial use and comparable with water from the municipal mains, the filtered water is passed through a softening process where the hardness is reduced from 140 milligram/liter to about 40 milligram/liter. The cost of the sewage reclaimed water is $.43/1000 imperial gallons as compared with $.72/1000 imperial gallons of municipal water. (See also W76-11257) (Kreager-FIRL)

GRANULAR MEDIA FILTRATION: A POSITIVE COST EFFECTIVE METHOD TO PREPARE WASTEWATERS FOR REUSE BY REMOVAL OF SUSPENDED SOLIDS,
Ecodyne Corp., Union, N. J. Industrial Waste Treatment Div.
G. R. Mace.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 185-190. 7 fig, 2 tab.

Descriptors: *Filtration, *Filters, *Granules, *Waste water treatment, *Suspended solids, Water reuse, Water reclamation, Recycling, Oil, Efficiencies, Performance, Equipment.
Identifiers: Backwashing.

The use of granular media filtration for removing suspended solids from waste waters which are intended for reuse has recently increased. Filters can effectively remove up to 200-250 ppm of suspended solids from waste waters and produce effluent clarities in the 1-15 ppm suspended solids range. Granular filters are also the only time-tested unit operation available for filtering volumes of waste water experienced in industrial waste treatment plants. Types of granular filter configurations available include: vertical gravity, deep media vertical gravity or pressure, horizontal ('hot dog'), concrete gravity, and upflow gravity or pressure types. A combination of air scouring, underdrain nozzles, and air metering tubes not only allows for the removal of suspended solids in the 200-250 ppm range but allows for the removal of up to 60 ppm of oil. Backwashing which is initiated by turbidity meters in addition to pressure differential and automatic timers is being employed to achieve the consistently low suspended solids levels required for recycling and discharge. (See also W76-11257) (Kreager-FIRL)
W76-11262

WASTEWATER RECYCLE - THE PROPER APPROACH TO EVALUATION OF DISPOSAL VERSUS REUSE,
Ecodyne Corp., Union, N. J. Industrial Waste Treatment Div.
G. R. Mace.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 191-195. 2 fig, 6 tab.

Descriptors: *Water reuse, *Water reclamation, *Waste water disposal, *Waste water treatment, *Industrial water, *Cost comparisons, *Cost analysis, Sludge disposal, Dewatering, Byproducts, Waste treatment, Economics, Water supply, Evaluation, Analytical methods, *Recycling.

A procedure for evaluating the cost of industrial waste water disposal versus recycle is presented. The procedure can be broken down into four major steps: a detailed analysis of the effluent; the effect of recycle water on the quality of the product; an analysis of waste treatment operations available; and the total economic analysis. The disposal of sludge is an especially important consideration since it is the most expensive part of the treatment system. The cost of sophisticated equipment to recover waste products should be weighed against direct disposal via landfill. The total economic analysis can be broken down into three independent analyses that need to be constructed: economic selection of individual waste treatment unit operations, economic selection of dewatering and sludge disposal alternatives, and the final economic decision of recycle versus disposal. A hypothetical case study is presented to illustrate the procedure. (See also W76-11257) (Kreager-FIRL)
W76-11263

THE EFFECTIVENESS OF GRANULAR ACTIVATED CARBON IN TREATING MUNICIPAL AND INDUSTRIAL WASTEWATERS,
ICI United States, Inc., Wilmington, Del.
P. B. DeJohn.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976. Cincinnati, Ohio, p 204-211. 3 fig, 7 tab, 20 ref.

Descriptors: *Adsorption, *Activated carbon, *Waste water treatment, *Granules, Municipal wastes, Industrial wastes, Physical properties, Coals, Performance, Isotherms, Measurement.
Identifiers: Municipal-industrial waste treatment, *Combined treatment

The use of granular activated carbon adsorption for treating municipal and industrial waste water is discussed. Topics covered include: methods for evaluating activated carbon, adsorption data developed on municipal wastes, the comparative physical properties of lignite and bituminous coal carbons, adsorption data developed on various types of industrial wastes, the effect of thermal regeneration on the adsorption performance of carbon, and symbiotic processes involving the utilization of carbon fines in other waste water processes and the utilization of the heat content of exit gases from other plant processes to regenerate activated carbon. Virgin bituminous coal carbons perform better than virgin lignite carbons in waste streams containing predominantly small molecules and vice versa. If the waste stream contains mostly small molecules, he granular carbon system should be designed on the basis of the performance of regenerated carbon. Isotherms can be used to determine if carbon can reduce the impurity level to the desired quantity. (See also W76-11257) (Kreager-FIRL)
W76-11264

SALA-HGMS MAGNETIC FILTERS FOR THE TREATMENT OF COMBINED SEWER OVERFLOW,
Sala Magnetics, Inc., Cambridge, Mass.
D. Allen, B. Arvidson, J. Oberteuffer, and R. Sargent.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 239-251. 8 fig, 12 tab, 19 ref.

Descriptors: *Filters, *Magnetic studies, *Waste water treatment, *Filtration, Sewage, Storm water, Flocculation, Chemical reactions, Performance, Suspended solids, Heavy metals, Bacteria, Biochemical oxygen demand, Chemical oxygen demand, Turbidity, Pilot plants, Separation techniques, *Combined sewers.
Identifiers: *Magnetic separation filters.

Bench test and preliminary pilot results are presented for the treatment of combined storm overflow and raw sewage with high gradient magnetic separation filters. Good performance was obtained with a flocculation train residence and filtration time of 3 minutes or less, a fraction of th

ne required fro flocculation and processing in nventional waste treatment systems. Although e flocs formed were very small in size compared th those necessary for conventional settling or tering, the flocs themselves were much less sceptible to physical disruption. There were also lications that the addition of a magnetic filter aid ch as magnetite can reduce chemical reaction ie to less than 90 seconds. Pilot plant tests on nbined sewage overflow revealed cycle to cycle riations in performance not exceeding 2%, in- ating the system's stability. The data also in- ated that the results obtained with seeded high dient magnetic filtration generally surpass se obtained with primary and secondary stages conventional treatment in a single treatment ge. Typical data are presented for suspended ids, biochmical oxygen demand, chemcial ox- n demand, turbidity, heavy metals, and bac- al counts. (See also W76-11257) (Kreager- RL)

ERSE OSMOSIS PILOT PLANT STUDIES THE PURIFICATION AND REUSE OF EF- NT FROM A SANITARY WASTE TREAT- T PLANT,
vell International, Golden, Colo. Rocky Plant.
Plock, D. E. Hausburg, and D. R. Horrell.
rd National Conference on Complete Reuse, June 27-30, 1976, Cincinnati, Ohio, p 3. 4 fig, 5 tab.

iptors: *Reverse osmosis, *Waste water ent, *Water reuse, *Reclaimed water, Sani- ngineering, Treatment facilities, Equipment, nation, Dissolved solids, *Pilot plants, Per- nce.

Pilot plant studies on the use of reverse osmosis to treat sanitary waste treatment effluent for reuse at a nuclear weapons facility were conducted. After passing about 20 gallons/minute of treated sanitary effluent through a pre-treatment stage, a chemical treatment stage, and a final filter, a reverse osmosis unit using cellulose triacetate hollow fiber membranes was employed to produce about 17.5 gallons/minute of product water and 2.2 gallons/minute of brine for a water recovery of 89%. Cellulose triacetate membranes were selected over polyamide hollow fiber membranes because of the following advantages: lower operating pressures, high rejection rates, higher quality product water, higher water recovery, lower inorganic scaling, the absence of bacterial fouling, and less susceptibility to temperature change. The pilot plant studies indicate that a product water containing less than 100 mg/liter of total dissolved solids can be obtained and that the flow of brine to the process waste treatment evaporator will be no greater than 2% of the feed stream going to the reverse osmosis recycling plant. W76-11267

RECLAMATION OF GAS TURBINE WASTE HEAT FOR SLUDGE DRYING,
Metropolitan Sewerage District of the County of Milwaukee, Wis.
L. A. Ernest, R. E. Birner, J. H. Schlintz, and R. M. Manthe.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 361-369. 2 fig, 2 tab, 1 ref.

Descriptors: *Sludge treatment, *Drying, *Heat transfer, *Symbiosis, *Byproducts, Treatment facilities, Equipment, Powerplants, Efficiencies, Temperature, Activated sludge, *Waste water treatment.
Identifiers: Combined cycles, Waste heat reuse.

The recovery of gas turbine waste heat for sludge drying at an activated sludge waste water treatment plantis described. Waste heat from gas turbines in the power generation section of the waste water treatment plant is diverted to 10 dryer furnaces to provide a drying temperature of 1200 F. This combined cycle operation reduces dryer fuel requirements by 70% and overall actual fuel consumption by 20%. The system is inherently safe because the dryers are normally at a negative pressure condition and consequently impose no detrimental back pressure on the gas turbine or connecting duct work. In addition, pressure sensitive devices dump the exhaust gases in the event of excessive back pressure to protect the system. (See also W76-11257) (Kreager-FIRL)

WASTEWATER REUSE WITHIN AN ARMY FIELD HOSPITAL,
Army Medical Bioengineering Research and Development Lab., Fort Detrick, Md.
W. P. Lambert, and L. H. Reuter.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 447-456. 4 tab, 41 ref.

Descriptors: *Water reuse, *Reclaimed water, *Waste water treatment, *Hospitals, Potable water, Treatment facilities, Equipment, Efficiencies, Water purification, Brackish water, Freshwater.

A waste water reuse scheme proposed for transportable army field hospitals is described. The waste water reclamation and recycling system is designed to help meet water supply needs, to reduce logistical requirements, and to maintain necessary tactical flexibility. The system has two principal operating modes and three primary functions. An integrated mode functions to treat nonsanitary waste streams for nonpotable reuse; operation requires 85% net influent water recovery at approximately 4200 gallons/day outflow. The purified water will be used for potable use eventually. The second mode of operation has two functions. Nonsanitary waste waters from the hospital are treated for discharge to the environment by one set of unit processes, while a water purification unit treats natural fresh or brackish waters for potable use. The second operation mode involves the production of at least 3900 gallons/day of treated waste water, with at least 94% of the influent being discharged. The water purification unit produces at least 3500 gallons/day of potable water with no more than 10% influent loss. (See also W76-11257) (Kreager-FIRL)

TREATMENT OF ARMY M U S T FIELD HOSPITAL WASTEWATER FOR WATER REUSE,
Abcor, Inc., Cambridge, Mass. Walden Research Div.
A. Z. Gollan, M. H. Kleper, K. J. McNulty, and R. L. Goldsmith.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 462-475. 11 fig, 7 tab, 5 ref.

Descriptors: *Waste water treatment, *Desclination, *Water reuse, *Reclaimed water, *Hospitals, *Treatment facilities, Reverse osmosis, Filtration, Ozone, Chlorination, Organic compounds, Water purification, Carbon, Chemical oxygen demand, Solid wastes, Performance, Evaluation, Efficiencies, Equipment.
Identifiers: Ultrafiltration.

A 1/4-scale breadboard version of a waste water treatment system designed for transportable Army hospitals was tested. The system is designed for operation in water reuse, water desalting, and waste treatment/discharge modes. The test demonstrated that the selected sequence of unit processes (waste equalization, ultrafiltration, reverse osmosis, ozonation, and chlorination) was effective in treating a time-varying composite of individual hospital wastes. The ultrafiltration and reverse osmosis stages were highly effective in reducing the total solids and organics concentrations of the equalized waste. Overall removal efficiencies for the ultrafiltration/reverse osmosis section ranged from 88-92% for total solids, 91-93% for total organic carbon, and 92-97% for chemical oxygen demand. Rather poor removal efficiencies were obtained for the ozonation system tested. The poor performance of the ozonation system was a result of reactor design and operation, the low output of the ozone generator, the presence of a refractory organic residual in the reverse osmosis permeate, and the lack of an automatic feedback system to control ozone conversion. The average overall system water recovery for the water reuse mode was 87%. (See also W76-11257) (Kreager-FIRL)

THE REMOVAL OF METALS FROM WASTEWATERS BY CHEMICAL TREATMENT AND FILTRATION,
Dallas Water Reclamation Research Center, Tex.
A. C. Petrasek, Jr., and S. E. Esmond.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 502-509. 6 fig, 14 tab.

Descriptors: *Waste water treatment, *Metals, *Coagulation, *Filtration, Sewage, Lime, Arsenic compounds, Cadmium, Chromium, Mercury, Lead, Efficiencies, Performance, Evaluation, Biological treatment.
Identifiers: *Chemical treatment, Recarbonation, Alum.

The use of various chemical treatment methods along with filtration for the removal of metals from waste waters was investigated. Waste water from a sewage treatment plant was given addi-

UNIVERSITY OF ILLINOIS-URBANA-CHAMPAIGN

tional biological treatment in a completely mixed activated sludge system was chemically coagulated and filtered, and passed through an activated carbon contactor. For the chemical treatment stage three different approaches were investigated: high pH lime coagulation, alum coagulation, and high pH lime coagulation and recarbonation. High pH lime coagulation and recarbonation was generally more effective in removing metals than was alum coagulation. This was especially true for toxic metals such as arsenic, cadmium, chromium, mercury, and lead. Detailed removal percentage and changes in mean metals concentrations are reported for 25 metals. WATER REUSE RESEARCH.
Dallas Water Reclamation Research Center, Tex.
A. C. Petrasek, Jr., and I. M. Rice.
In: 3rd National Conference on Complete WaterReuse, June 27-30, 1976, Cincinnati, Ohio, p. 556-566, 11 fig, 13 tab, 5 ref.

Descriptors: *Waste water treatment, *Metals, *Coliforms, *Coagulation, Biological treatment, Activated sludge, Flocculation, Filtration, Adsorption, Chemical oxygen demand, Carbon, Organic compounds, Nitrogen, Nitrates, Ion exchange, Microorganisms, *Water reuse, Lime, Evaluation, Performance, Treatment facilities, Denitrification.
Identifiers: Recarbonation.

Various waste water treatment sequences were evaluated as part of a research program for developing water reuse systems. The treatment sequences evaluated consisted of the following unit processes operating in series, with the most significant difference being the type of chemical treatment utilized in the sequence: biological treatment with completely mixed activated sludge, chemical coagulation, flocculation, and clarification, multi-media filtration, and activated carbon adsorption. A chemical treatment sequence employing high pH lime coagulation and recarbonation appeared to result in the best metals removals. High pH lime coagulation was also very effective for removing indicator (coliforms) of pathogenic bacteria. Low chemical oxygen demand and soluble total organic carbon concentrations were obtained with all of the treatment processes investigated. Nitrogen removal was not a problem because of uncontrolled denitrification in the final clarifier on the activated sludge system. However, nitrate nitrogen concentrations did closely approach the 10 mg/liter standard, and the addition of an anion exchange system capable of processing about 25% of the total product water appears desirable. WATER FACTORY 21.
Orange County Water District, Fountain Valley, Calif. Board of Directors.
D. G. Argo.
In: 3rd National Conference on Complete WaterReuse, June 27-30, 1976, Cincinnati, Ohio, p. 567-577, 16 fig, 3 tab, 5 ref.

Descriptors: *Waste water treatment, *Reclamation, *Treatment facilities, *On-site tests, *Reclaimed water, *Water reuse, Organic compounds, Viruses, Turbidity, Heavy metals, Bacteria, Coagulation, Lime, Adsorption, Activated carbon, Chlorination, Filtration, Ammonia, Design criteria, Performance.
Identifiers: Recarbonation, Ammonia stripping.

The design and start-up of a full-scale advanced design waste water reclamation plant that is part of the Orange County California Water Factory 21 are described. The waste water reclamation plant is designed to treat 15 mgd of trickling filtered secondary effluent. The plant processes include: lime coagulation, ammonia stripping, two-stage recarbonation, mixed-media filtration, activated carbon adsorption, chlorination, and blending. During the initial start-up of the plant, its ability to meet its discharge objectives was demonstrated for all parameters except mineral quality. The plant effectively removed organics, turbidity, heavy metals, bacteria, and viruses. A waste water demineralization plant is being constructed so that the mineral quality objective can be attained. Detailed diagrams are illustrated for each process and plant effluent data are compared with discharge objectives. (See also W76-11257) (Kreager-FIRL)
W76-11273

FLY ASH - A POTENTIAL ASSET IN WASTE-WATER TREATMENT.
Northwestern Univ., Evanston, Ill.
N. Gangoli, and G. Thodos.
In: 3rd National Conference on Complete WaterReuse, June 27-30, 1976, Cincinnati, Ohio, p. 623-628, 4 tab, 29 ref.

Descriptors: *Fly ash, *Byproducts, *Waste water treatment, *Sludge treatment, Industrial wastes, Chemical oxygen demand, Organic compounds, Heavy metals, Phosphates, Dewatering, Phenol, Alkyl benzene sulfonate, Odor, Surfactants, Adsorption, Coagulation, Chemical precipitation.

Applications which utilize fly ash in waste water treatment operations are reviewed. Fly ash has been used as a filter aid in dewatering sewage sludges as a coagulant and precipitating agent, and for adsorbing dissolved substances in waste waters. In addition to enhancing the dewatering of activated and digested sludges, fly ash is also effective in removing organics and phosphates. Fly ash has been used as an adsorbent for the recovery of phenol from industrial waste waters and for the removal of alkyl benzene sulfonate, a surfactant used in detergents. Paper mill effluents have been treated with fly ash in eliminating of odor and the removal of chemical oxygen demand. The high alkalinity associated in fly ash makes this substance an excellent treatment aid for the precipitation of heavy metals present in the effluent streams of electroplating and metal finishing industries. FEASIBILITY OF CHLORINATING FEEDLOT RUNOFF TO MEET BACTERIAL WATER QUALITY STANDARDS.
Maryland Univ., College Park. Dept. of Agricultural Engineering.
J. A. Merkel.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 576, $3.50 in paper copy, $3.00 in microfiche. Maryland Water Resources Research Center, College Park, Technical Report No. 37, (1976). 15 p, 5 tab. OWRT A-024-Md(1) 14-13-0001-5020.

Descriptors: *Agricultural runoff, Organic wastes, Runoff, Coliforms, Chesapeake Bay, *Salinity, Livestock, *Chlorination, *Feed lots, *Farm wastes, Water quality standards, *Waste water treatment, Bacteria, *Bactericides.
Identifiers: Detention ponds.

An increase in livestock production along with a more intensive usage of the Chesapeake Bay by boaters, vacationers, and the local population has placed increased demands on the organic carrying capacity of the Bay and its tributaries. This situation was brought into focus in 1971 when the Maryland State Department of Health and Mental Hygiene was forced to close certain shellfish waters and issue cease and desist orders to tweny livestock producers due to bacterial counts that exceeded water quality standards. Part of the problem was believed to be the result of runoff from poorly designed and managed livestock waste handling practices. The primary purpose of this study was to determine the parameters that could be used for effectively treating effluent from livestock operations before discharging it into streams. The results indicate that 'tailing' or increasing the salinity of the effluent is an effective means of reducing the bacterial population of the liquid waste. This technique coupled with detention ponds, provides a method for controlling the quality of the runoff before it is allowed to enter shellfish areas.

BIOLOGICAL PURIFICATION OF HIGHLY CONCENTRATED SPENT SODIUM SULFITE PULPING LIQUORS (ETUDE DE L'EPURATION BIOLOGIQUE DE LESSIVES RESIDUAIRES AU SULFITE DE SODIUM DE FORTE CONCENTRATION).
Grenoble University, Grenoble, France.
J. Quilès-Mottiaux.
Ph.D. Thesis, 1971, 116 p, 36 plates, 24 fig, 49 ref, 23 tab.

Descriptors: *Sulfite liquors, *Pulp wastes, *Biological treatment, *Waste water treatment, Wastes, Industrial wastes, Aeration, Waste treatment, Temperature, Hydrogen ion concentration, Nutrients, Biochemical oxygen demand, Microorganisms, Chemical precipitation, Chemical degradation, Ozone, Color, Water pollution treatment, Water pollution control, Hardwood, *Chemical oxygen demand.
Identifiers: NSSC (Neutral sulfite semichemical) pulping.

Studies on the biological purification of concentrated spent liquors from the NSSC (neutral sulfite semichemical) pulping of hardwoods are reported. Following preliminary investigations on the development of microorganisms, the optimum composition of the medium, and optimum aeration conditions, temperature, pH, and nutrient additions, discontinuous biological purification tests were carried out using a tenfold spent liquor dilution, temperature of 25C, pH of 8.5, treatment period of 48 hr, and specific N, P, K, Mg, Mo, and Mn nutrient additions. The 5-day BOD of the spent liquor was found to decrease from 3500 (tenfold diluted liquor) to 650 mg/liter. This was followed in turn, by semi-industrial continuous tests (8-fold liquor dilution, 25C, 24 hr), using a special strain capable of developing in concentrated liquor. BOD was again reduced to 650 mg/liter (86%), COD from 43,700 to 20,600 mg/liter (53%). Two methods were then examined for further reduction of COD, viz., removal of pollutants via precipitation, and chemical degradation of liquor constituents. Best results were obtained with ozone treatment. When followed by biological purification, ozone gave a BOD reduction of 98.8% and a COD reduction of 70%. Significant decoloration of the effluent was also obtained. (Speckhard-IPC)

EXTENDED AERATION IN A COMBINED WASTEWATER TREATMENT PLANT.
Jordan, Jones and Goulding, Inc., Atlanta, Ga.
B. G. Turner, E. A. Clark, M. H. Poythress, and J. P. McHugh.
In: TAPPI Environmental Conference, Atlanta, Georgia, April 26-28, 1976, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 65-79, 6 fig, 3 ref, 10 tab.

Descriptors: *Waste water treatment, *Pulp wastes, *Treatment facilities, *Municipal wastes, Water pollution sources, Water pollution treatment, Water pollution control, Wastes, Waste treatment, Industrial wastes, *Georgia, Aerated lagoons, Water purification, Sludge disposal, Operation and maintenance, Water quality control, Sewage treatment, Dissolved oxygen, *Aeration.
Identifiers: Kraft mills, Board mills, Ocmulgee River/Ga), *Extended aeration, Combined treatment.

A 14 million gal/day effluent treatment plant was placed in operation in spring, 1975, to purify Georgia Kraft Co.'s 900 ton/day kraft linerboard mill discharges along with 5 million gal/day of primarily domestic wastewater from the city of Macon, Georgia. The linerboard mill has implemented steps to improve and reduce its effluent discharges. The water pollution control plant (designed after extensive pilot plant studies) operates without primary clarification and includes two aeration basins (7 million gallon capacity each), each equipped with five 125-hp mechanical aerators, and two 115-ft diameter secondary clarifiers. Waste sludge is discharged to a short-term aerated holding basin with sludge-decanting capability. A series of sludge-disposal evaluations involving pilot and bench-scale studies of various types of sludge-dewatering and disposal equipment have been conducted. Operating experience with the plant is reviewed. Certain difficulties with solids settleability have caused poorer than desired effluent characteristics, but reasonable solutions to this problem are available. Water quality on the Ocmulgee River downstream from Macon has improved. In the summer of 1975, the lowest dissolved oxygen level did not violate stream standards. Otherstream quality parameters show similar improvement. (Sykes-IPC)

BIOMETER MEASUREMENT OF ACTIVATED SLUDGE AT WESTVACO CORPORATION.
Westvaco Corp., Covington, Va. Covington Research Center.
O. A. Campbell, and W. D. Major.
In: TAPPI Environmental Conference, Atlanta, Georgia, April 26-28, 1976, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 122-140, 10 fig, 15 ref, 2 tab.

Descriptors: *Activated sludge, *Pulp wastes, *Waste water treatment, *Biomass, *Instrumentation, Wastes, Industrial wastes, Waste treatment, Bioluminescence, Biochemical oxygen demand, Chemical oxygen demand, Oxygen requirements, Photometry, Suspended solids, Enzymes, Water pollution treatment, Water pollution control, Analytical techniques, Virginia, Pollutant identification.
Identifiers: DuPont 760 Luminescence Biometer.

The DuPont 760 Luminescence Biometer used for this study is a sensitive photometer designed to measure bioluminescence released by the firefly luciferase-luciferin reaction. In this manner, adenosine triphosphate (ATP) enzyme, a constituent of all living cells, can be measured and related quantitatively to viable cells (biomass) in pure cultures. Objectives of the described project were to determine quantitatively the amount of viable matter in the final effluent suspended solids as well as other points in a waste treatment plant, and to investigate the feasibility of using biomass measurement as an operating parameter. An attempt was made to relate biomass to plant performance (BOD removal, COD, and oxygen uptake). The Biometer detected biomass, however, the quantitative relationship to specific numbers (colonies) or to weight of living matter is questionable in mixed cultures. Relative levels of biomass in the water treatment plant were established and were relatively consistent. Substantial dynamic changes in biomass in activated sludge, if they occur, were not detected with the Biometer in these tests. Biomass measurements do not relate to performance. (Sykes-IPC)
W76-11375

PROCESS WASTEWATER: RECLAMATION OR DISPOSAL.
Sandwell International Inc., Atlanta, Ga.
P. H. Rath.
In: TAPPI Environmental Conference, Atlanta, Georgia, April 26-28, 1976, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 109-113, 4 tab.

Descriptors: *Pulp wastes, *Biological treatment, *Water reuse, *Waste water disposal, Wastes, Industrial wastes, Waste water treatment, Water pollution sources, Water pollution control, Water pollution treatment, Activated sludge, Economics, Suspended solids, Capital costs, Treatment facilities, Legislation, Water consumption/Except consumptive use), Water conservation.
Identifiers: Kraft mills, Spills, Process waste water.

Biological treatment is the predominant means chosen by the U.S. pulp and paper industry to comply with 1977 discharge limits. Two mills (a 250 ton/day kraft pulp and paper mill producing specialty papers and a 1000 ton/day kraft pulp and paper mill producing linerboard, sack paper, and bleached market pulp) having activated sludge plants have evaluated installation of new facilities for spill collection, foul condensate treatment and waste water volume reduction. The economic justification for these in-plant changes is summarized. The impact of proposed 1983 discharge limits on existing mills is summarized with reference to in-plant conditions and reuse potential of treated wastewater. In-plant reduction of wastewater volume is beneficial in reducing total effluent suspended solids, lowering capital cost of new treatment facilities, and providing production cost savings, and is essential for stable operation of an activated sludge plant. Treated effluent reuse potential for most integrated mills is in the range of 5 to 20% of total mill water requirements. Additional treatment to the 1983 discharge compliance level will not significantly increase the suitability of final effluent for reuse. Most existing mills will be forced to install additional external treatment facilities to meet 1983 discharge limits. Expenditures for such external treatment facilities can be minimized by reducing process water consumption. (Sykes-IPC)
W76-11376

CHESAPEAKE CORPORATION OPERATING EXPERIENCE WITH A HIGH PURITY OXYGEN ACTIVATED SLUDGE WASTE TREATMENT SYSTEM.
Chesapeake Corp. of Virginia, West Point.
K. R. Gilbreath.
In: TAPPI Environmental Conference, Atlanta, Georgia, April 26-28, 1976, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 141-144, 1 fig, 2 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Activated sludge, *Oxygen, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Water pollution control, Virginia, Treatment facilities, Water purification, Biochemical oxygen demand, Microorganisms, Suspended solids, Biological treatment, Operation and maintenance, Virginia.
Identifiers: Kraft mills, UNOX process.

Chesapeake Corporation (West Point, Virginia) has operated a high-purity oxygen activated sludge treatment system on kraft mill effluent since May 1974. The wastewater treatment facility consists of a single primary clarifier, a three-cell cooling tower, a three-stage UNOX oxygen activated sludge basin, two secondary clarifiers, a sludge thickener-clarifier, and two coil-spring vacuum filters. With such a system, high BOD-removal efficiency is maintained even when filamentous organisms are present. Abrupt changes in the influent wastewater characteristics only slightly affected the effluent's 5-day BOD. Effluent total suspended solids concentration was more susceptible to fluctuation in the influent wastewater characteristics. The presence of filamentous organisms raises the effluent total suspended solids concentration and makes the system more susceptible to upsets. The biological system averaged 92-94% removal of BOD with an average effluent concentration of 30 mg/liter without filamentous organisms present and 90-94% BOD removal with an average effluent concentration of 32 mg/liter with filamentous organisms present. The effluent total suspended solids averaged 40 mg/liter without organisms and 75 mg/liter with organisms present. Settling characteristics of the biological organisms also deteriorated with filamentous organisms present as noted by an increase in the sludge volume index from 50 to 90 and by a decrease in the initial settling velocity from 5.5 to 3.5 ft/hr. (Sykes-IPC)
W76-11377

RESEARCH ON THE MECHANISMS FOR REMOVAL OF SOLUBLE BOD(5) IN CLARIFIER SYSTEMS,
Institute of Paper Chemistry, Appleton, Wis.
G. A. Dubey, A. J. Wiley, and J. W. Collins.
In: TAPPI Environmental Conference, Atlanta, Georgia, April 26-28, 1976, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 145-155. 4 fig, 10 ref, 16 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Biochemical oxygen demand, *Water purification, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Water pollution control, Iron compounds, Hydrogen ion concentration, Solubility, Flocculation, Costs, Chemical precipitation, Laboratory tests, Chromatography, Water pollution, Water quality.
Identifiers: Ferric chloride, Aluminum sulfate, *BOD5.

Primary clarifiers used for the treatment of wastes from the pulp and paper industry vary widely in the amount of 5-day BOD they remove. In a survey of effluents from 19 pulp and paper mills (9 with clarifiers), it was found that a large part of the 5-day BOD was due to soluble materials. Analyses of effluent from mills having clarifiers indicated a large proportion of 5-day BOD remaining in the discharge streams was also due to soluble components. The soluble 5-day BOD was markedly reduced in a number of mill effluents with ferric chloride and alum under carefully controlled laboratory conditions. Gel chromatographic studies with mill effluents before and after clarification and work done with model compounds in pure solution showed that the soluble 5-day BOD components which were removed could be both high- and low- molecular weight compounds. The removal is apparently related to the pH of the solution and to the functional groups (hydroxyl, phenol, or carboxyl), chain length, branching, and solubility of the compounds. Decreased costs and increased operating efficiency in the primary clarifiers using flocculating agents to remove 5-day BOD depends on the reduction, elimination and/or separate treatment of streams which are detrimental to the system. (Sykes-IPC)

BOARD MILL WASTEWATER TREATMENT SYSTEM WITH COUNTERCURRENT DISSOLVED AIR FLOTATION THICKENING AND VACUUM FILTER DEWATERING,
Ingersoll-Rand Co., Nashua, N.H.
J. T. Albert, and A. R. Taylor.
In: TAPPI Environmental Conference, Atlanta, Georgia, April 26-28, 1976. Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 197-199. 1 fig, 2 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Flotation, *Filtration, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Water pollution control, Biochemical oxygen demand, Suspended solids, New Hampshire, Treatment facilities, Equipment, Sewage treatment, Dewatering, Filters.
Identifiers: Board mills, Hoague-Sprague Boxboard Mill(West Haven N.H.).

A newly developed countercurrent flotation separation (CFS) and a traveling-belt vacuum filtration system proved to be an effective method to treat board mill wastewater at the Hoague-Sprague Boxboard Mill in West Haven, New Hampshire. The CFS unit reduces the influent suspended solids ranging from 990-3758 mg/liter to 24-93 mg/liter (92-98% removal) and the 5-day BOD by 25-43%, resulting in an effluent BOD of 649-2067 mg/liter. The effluent BOD is reduced further by secondary treatment. Floated solids are concentrated to 6.4-9.3% and dewatered by the traveling-belt vacuum filter at 4.2-5.2 lb/sq ft/hr loading rate. The dry solids in the filter cake range between 19.3 and 22.3%. (Sykes-IPC)

UNOX SECONDARY SLUDGE DEWATERING STUDIES AT LONGVIEW FIBRE COMPANY,
Longview Fibre Co., Wash.
J. E. Goodwin.
In: TAPPI Environmental Conference, Atlanta, Georgia, April 26-28, 1976, Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 221-224. 9 tab.

Descriptors: *Sludge treatment, *Pulp wastes, *Dewatering, Wastes, Industrial wastes, *Waste water treatment, Water pollution sources, Water pollution treatment, Sludge disposal, Incineration, Equipment, Centrifugation, Filters, Aerobic treatment, Drying, Solid wastes, Water pollution control, Washington.
Identifiers: Tate-Andritz belt press, UNOX process.

A secondary sludge-dewatering system was initiated at Longview Fibre Company (Longview, Washington) in conjunction with a UNOX secondary treatment system. Sludge disposal via injection into the lime mud vacuum filters or the centrifuges, and via dewatering and incineration were investigated. Equipment evaluated during the dewatering studies included basket centrifuges, solid-bowl centrifuges, coil filters, pressure filters, belt presses, drying beds, gravity thickeners, and aerobic digesters. Results of the study indicated injection of the sludge into the mill system was not feasible. The injection of dilute secondary sludge into the lime mud system decreased the cake solids delivered to the kilns, necessitating the use of greater quantities of fuel. Of the dewatering devices tested, the Tate-Andritz twin-wire belt press gave the most reliable operation with acceptable solids yield. (Sykes-IPC)

WET AIR OXIDATION AT ONTONAGON,
Hoerner Waldorf Corp., Ontonagon, Mich.
J. E. Hoeft, and C. L. Soukup.
In: TAPPI Alkaline Pulping Conference, Williamsburg, Virginia, October 27-29, 1975. Preprinted Proceedings (TAPPI, Atlanta, Georgia), p 37-40. 1 fig.

Descriptors: *Pulp wastes, *Waste water treatment, *Oxidation, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Michigan, Municipal wastes, Treatment facilities, Electric power, Water pollution control, Waste treatment, Aeration.
Identifiers: *Wet air oxidation, Semichemical pulp mills, Chemical recovery, Corrugating medium, Compressed air.

Faced with the dual problem of complying with stringent new air and water pollution standards, and the need to increase productivity to make such compliance economically feasible, Hoerner Waldorf Corporation opted for a unique semichemical pulping, recovery, and waste treatment system at its Ontonagon, Michigan, paper mill. The Zimpro wet air oxidation system replaced the existing recovery furnace which did not meet environmental standards of the state of Michigan. The system is based on the scientific principle that organic material in aqueous solution can be oxidized to carbon dioxide and water by air, under pressure and at temperatures of 350-700F. The system recovers pulping chemicals, generating energy during the process, and treats both mill effluent and municipal sewage from the village of Ontonagon. The cost of these environmetal improvements made it necessary for the company to add a second paper machine. The mill produces corrugating medium. (Witt-IPC)

m hydroxide, Kraft mills.

ical purification of kraft mill effluent with
num sulfate, which involves the sorption of
tants on aluminum hydroxide, requires a suf-
t alkalinity in the effluent for the formation
e sorbent (aluminum hydroxide). Therefore,
lations between the dose of coagulant and
the alkalinity and color of the effluent were
igated. Mill practice shows that in many
the alkalinity of the effluent is higher than
sary for hydrolysis of the amount of alu-
n sulfate needed, and an excess must be used
ain the optimum pH for coagulation. In such
the amount of aluminum sulfate can be
ed by partially neutralizing the effluent with
ic acid. Based on experimental data and their
ical analysis, functional relations were
d (1) between the dose of coagulant and al-
y (for practical purposes the dose equals al-
y), (2) between the optimum dose after the
um possible reduction of alkalinity, and (3)
en the amount of sulfuric acid which can be
to the alkalinity and color of the effluent.
e of these relations will eliminate time-con-
g coagulation tests to determine the needed
f coagulant. (Stapinski-IPC)

Identifiers: USSR.

One of the newest methods of intensification of effluent purification, the biosorption method, has been recently introduced at the Bratsk wood-processing complex (Siberia). This method consists in adding the excess activated sludge to the effluent in the primary sedimentation tank, aerating the mixture for a short time, and separating the sediment along with the sludge. Studies of this process have shown that in the presence of activated sludge (in an amount considerably smaller than in the aeration tank) and aeration (for about 3 hr) the degree of effluent clarification increasess by 20%, and its BOD is reduced by about 30%. This increases the degree of biological purification in the aeration tanks from 94.5 to 97.5%. At the same time the process increases the capacity of the purification equipment (in terms of BOD) by 12.4% and reduces the cost of purification. The method is particularly well suited for highly polluted effluents. (Stapinski-IPC)

Identifiers: *White water(Paper machines), Aluminum sulfate, Polyacrylamide, Ukraine, Board mills, Fiber recovery, Closed systems, Waco filters, USSR.

The Ukrainian board mill in Lvov produces 31,000 tons of boxboard annually on two cylinder mold machines. The mill is experiencing a shortage of process water, as its sources are artesian wells, and is faced with the necessity of introducing a closed water cycle. The first step in this direction was an improvement in the waste water treatment system to increase its degree of purification (which up to now was only 40-50%). This system is described and illustrated with a diagram. The fibers recovered from two Waco filters are reused in stock preparation. The partially clarified white water goes to two vertical sedimentation tanks where it is treated with aluminum sulfate and polyacrylamide. The degree of purification is presently 90%. The amount of aluminum sulfate added is 240 g/liter, the amount of polyacrylamide 10 g/liter. The purified white water, which can be recycled, contains 58 mg of suspended solids/liter, has a pH of 6.5, a COD of 192 mg/liter, and a permanganate oxidizability of 150 mg/liter. It is used for washing felts and cylinder mold wires. (Stapinski-IPC)

A CHEMICAL-BIOLOGICAL TREATMENT PROCESS FOR CELLULOSE NITRATE DISPOSAL,
Army Natick Development Center, Natick, Mass.
T. M. Wendt, and A. M. Kaplan.
Journal Water Pollution Control Federation, Vol. 48, No. 4, p 660-668, April, 1976. 2 fig, 24 ref, 3 tab.

Descriptors: *Biological treatment, *Waste water treatment, *Chemical degradation, Water pollution sources, Industrial wastes, Anaerobic digestion, Denitrification, Aerobic treatment, Activated sludge, *Nitrates, Biochemical oxygen demand, Carbon, Chemical oxygen demand, *Waste disposal, Water pollution control, Alkalis(Bases).
Identifiers: *Cellulose nitrate, Sodium hydroxide.

A newly developed means of disposing of cellulose nitrate involves chemical pretreatment of the biologically stable cellulose nitrate polymer, using an alkali (e.g., NaOH), followed by biological treatment. The biological treatment process consists of sequential anaerobic denitrification and aerobic activated sludge treatment steps. This continuous process reduces to nitrogen gas more than 95% of the nitrate produced during alkali digestion of cellulose nitrate and nitrate produced by nitrification in the aerobic portion of the process. Five-day BOD, total organic carbon, and COD removals averaged 88.6, 54.5, and 55.2%, respectively. The process provides an environmentally acceptable alternative to more common physical means of disposal such as open burning. (Witt-IPC)

PROCESS FOR SEPARATING LIQUIDS FROM SUSPENSIONS,
Department of the Interior, Washington, D. C. Office of the Secretary. (Assignee).
L. W. Brandt.
U.S. Patent No. 3,956,116, 5 p, 3 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 946, No 2, p 728, May 11, 1976.

Descriptors: *Patents, *Waste water treatment, *Phosphates, *Water pollution sources, *Slime, Suspension, Suspended solids, Separation techniques, Water purification, Settling basins, Equipment, Screens.
Identifiers: Phosphate mining.

This invention relates to a process for accelerating the separation of liquid from solids in a very slow-settling suspension or a slime, by means of a single mechanical operation which effects the compaction of the solids in a relatively short period of time. The process involves the movement of a relatively large mesh screen or net through the suspension at a slow steady rate with the result that the solid material is concentrated or compacted ahead of the moving screen leaving a clarified liquid behind the moving screen. In some instances, there may be a flocculant material employed as an aid in agglomerating the ultrafine solids. It is an object of this invention to provide a rapid method for separating liquid from solids in very slow-settling suspension without the necessity of employing chemical additives or using centrifuges or filters and to provide an improved process for treating phosphate slime to recover clarified water and concentrated minerals. (Sinha-OEIS)

CATIONIC POLYMERS FOR BREAKING OIL-IN-WATER EMULSIONS,
Nalco Chemical Co., Oak Brook, Ill. (Assignee).
R. L. Bradley, A. J. Sadowski, and E. G. Ballweber.

LIBRARY U. OF I. URBANA-CHAMPAIGN

U.S. Patent No. 3,956,117, 4 p, 4 ref; Official Gazette of the United States Patent Office, Vol 946, No 2, p 728, May 11, 1976.

Descriptors: *Patents, *Industrial wastes, *Oil pollution, *Oily water, Water pollution treatment, Water pollution control, Water quality control, *Emulsions, Dispersion, Polymers, Flocculation, Separation techniques.
Identifiers: Oil-in-water emulsions.

A method has been discovered for resolving oil-in-water emulsions through the treatment of these emulsions with a water-soluble condensation copolymer of 1,4-dichloro-2-butene and a lower aliphatic secondary amine. Dispersing this water-soluble copolymer within the emulsion causes the emulsion to break and separate into an aqueous phase and an oil phase. The oil phase may then be removed by conventional methods. In one embodiment of the invention the addition and mixing of the water-soluble copolymer is followed by the addition and dispersal of one or more flocculants. The additional flocculants encourage rapid agglomeration of the flocs and thereby facilitate removal of the oil. (Sinha-OEIS)
W76-11449

FLOCCULATION PROCESS,
Mobil Oil Corp., New York. (Assignee).
J. C. Davidtz.
U.S. Patent No. 3,956,119, 6 p, 4 ref; Official Gazette of the United States Patent Office, Vol 946, No 2, p 729, May 11, 1976.

Descriptors: *Patents, *Waste disposal, *Phosphates, *Water pollution sources, *Flocculation, *Slime, Dewatering, Topsoil, Organic matter, Sludge disposal, Water reuse, Landfills, Settling basins.
Identifiers: Phosphate mining.

The dilute clay-containing slimes waste, formed in the hydraulic mining of phosphate mineral, is flocculated by mixing with an aqueous extract of fertile topsoil or with fertile topsoil which is the uppermost two feet or more of overburden that contains at least 200 parts per million organic matter extractable by water. Water is recovered from the flocculated mixture. The dewatered floc is preferably disposed at a land reclamation site and covered with overburden to restore the oridinal stable soil profile, i.e. an upper layer of soil with good drainage and a lower layer having poor drainage. One manner of utilizing the flocculated mixture of this invention is to store it in a quiescent state, i.e., without deliberate agitation other than that caused by wind, for a period of from 24 hours to about one month, in a pond or settling area. During such storage very effective sedimentation will occur with the copious formation of supernatant clear water than can be separated and returned for use in the mining process, or discharged to a river. (Sinha-OEIS)

PROCESS FOR THE PRECIPITATION OF HEAVY METAL ION-POLYCARBOXYLATE COMPLEXES,
Deutsche Gold- und Silber-Scheideanstalt A. G., Frankfurt-am-Main (West Germany).
H. Haschke, H. Knorre, G. Morlock, and G. Pohl.
U.S. Patent No. 3,956,121, 6 p, 4 ref; Official Gazette of the United States Patent Office, Vol 946, No 2, p 729-730, May 11, 1976.

Descriptors: *Patents, *Industrial wastes, *Water pollution treatment, Water pollution control, Water quality control, *Heavy metals, *Water pollution sources, Chemical wastes, *Chemical precipitation, Separation techniques.
Identifiers: Metal processing industry, Galvanizing.

This invention provides a process for the precipitation of heavy metal ion-poly-carboxylate complexes from their aqueous solutions. The process comprises first adding an aqueous solution of a water soluble aluminum salt, the anion of which does not form water soluble complexes with the metal ions to be precipitated or possibly such anion-heavy metal complexes having a stability constant of less than 2, expressed as its decadic (decimal)logarithm; to a solution containing the heavy metal ion-polycarboxylate complexes in such an amount that about 0.9 to 1,8 moles of aluminum ions are provided for each equivalent of the polycarboxylate. Subsequently, the pH is adjusted to about 6.5 to about 9.0. Both the complexing agents as well as the heavy metal ions are practically precipitated quantitatively. By the addition of the aluminum salt solution, the polycarboxylate-heavy metal ion-complexes are 're-complexed' to aluminum complexes. At the same time, the heavy metal ions liberated from the original complexes are precipitated as hydroxides or carbonates which are difficult to solubilize. The amorphous, voluminous aluminum complex possibly increases at the same time the quantitative separation of the heavy metals ions by producing an occluding effect. (Sinha-OEIS)

Descriptors: *Coagulation, *Waste water treatment, *Textiles, Wastes, Industrial wastes, Water pollution sources, Cations, Organic compounds, Foreign countries, Dyes, Water purification, Water pollution treatment, Water pollution control, Color, Biochemical oxygen demand, Separation techniques, Waste treatment.
Identifiers: Sedipur KA, Zabulen EP, Marwellan SF, Pilasol W, Direct dyes, Reactive dyes, *Poland, IS fixative.

Positive results obtained in coagulation of textile industry effluents with organic cationic compounds, such as Sedipur KA, prompted a search for more readily available domestic Polish coagulants. Some textile-finishing auxiliaries are cationic compounds. Preliminary experiments with two such agents produced in East Germany, Zabulen EP and Marwellan SF, gave encouraging results. These experiments were continued with a number of Polish additives. They were conducted on two types of concentrated cotton-dyeing effluents from the use of direct dyes and reactive dyes, respectively. Two agents, viz., Pilasol W and the fixative IS, gave good results with effluent containing direct dyes (complete decoloration, clarification, and considerable reduction of BOD). Only the fixative IS was effective in the case of effluent containing reactive dyes. (Stapinski-IPC)

COAGULATION OF TEXTILE INDUSTRY EFFLUENTS WITH FIXATIVE 'IS' (PROBY KOAGULACJI SCIEKOW PRZEMYSLU WLOKIENNICZEGO UTRWALACZEM IS),
Centralne Laboratorium Dziewiarstwa (Poland)
J. Rouba
Przeglad Wlokienniczy, Vol. 30, No. 2, p 94-96, February, 1976. 1 fig, 3 ref, 4 tab.

Descriptors: *Coagulation, *Waste water treatment, *Textiles, Europe, Wastes, Waste treatment, Industrial wastes, Water pollution sources, Water pollution treatment, Water pollution control, Color, Biochemical oxygen demand, Suspended solids, Surfactants, Cations, Organic compounds, Separation techniques, Sedimentation, Flotation, Water purification, Costs, Storage, Corrosion, Foreign countries
Identifiers: *IS fixative, *Poland

An earlier study of effluent coagulation with cationic compounds used in textile finishing showed that the fixative IS is the most effective. This agent is a condensation production of dicyandiamide with formaldehyde, and is produced at the Nitrogen Chemical plant in Kedzierzyn (Poland). When used for coagulation of total effluents from cotton-processing mills, it achieved complete decoloration, 50% BOD reduction, and 90% removal of suspended solids and anionic surfactants. Compared to inorganic coagulants, the cationic organic agents have the disadvantage of slow sedimentation and more difficult separation of the sediments. Laboratory experiments indicated that a faster and more convenient method of separation is pressure flotation. In about 15 minutes a good separation of the sediment from the coagulated effluent was obtained. The volume of the sediment was 3.8% of the coagulated effluent volume and its water content was 97.7%. Such sediments can be dewatered and then burned. Compared to inorganic coagulants, the cationic agents have the advantages of requiring a smaller dose, eliminating the introduction of water hardness salts into the purified effluent, and of lowering the costs of purification considerably. The IS fixative can be stored for at least one year and is noncorrosive. (Stapinski-IPC)

FLOCCULATION OF WASTEWATER WITH POLYELECTROLYTES AND FERRIC CHLORIDE,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
C. D. Walding.
Ph.D. Dissertation, 1975. 69 p, 3 tab, 20 fig, 24 ref.

Descriptors: *Flocculation, *Waste water treatment, *Polyelectrolytes, *Chlorides, Economic feasibility, Suspended solids, Polymers, Anions, Cations, Settling velocity, Chemicals, Testing, Costs.
Identifiers: *Ferric chloride.

Raw municipal wastewater can be efficiently and economically flocculated with polyelectrolytes and ferric chloride. Chemical and physical process variables which affect flocculation were studied, including flocculant types and dosages, suspended solids concentrations, chemical addition sequences and mixing intensities. Anionic polymers used following ferric chloride were more effective than cationic or nonionic types at equivalent dosages. The combined chemical system increases floc settling rates beyond those observed when using no chemicals or ferric chloride alone. Capital savings from more rapid settling rates can offset much of the cost of the chemicals. Experimental results are given for single and double flocculant systems, and cost op

zation is discussed. A bench scale modified jar was developed to improve sensitivity to initial ling rates. (Jahns-Arizona)

URBAN STORMWATER MANAGEMENT MODELING AND DECISION-MAKING,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
J. P. Heaney, W. C. Huber, H. Sheikh, M. A. Medina, and J. Doyle.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-242 290, $7.50 in paper copy, $3.00 in microfiche. Report EPA-670/2-75-022, May, 1975. 185 p, 37 fig, 47 tab, 92 ref.

Descriptors: *Decision making, *Model studies, *Rainfall, Runoff, *Waste water treatment, Erosion control, Water storage, Vegetation, Optimization, Cost analysis, Storm drains, Combined sewers, Water pollution, Computer programs, Streams, Storm water, Urban runoff, Cities, Urbanization.
Identifiers: Stream pollution, Storm Water Management Model (SWMM).

The Environmental Protection Agency (EPA) Storm Water Management Model (SWMM) was tested, refined, and augmented to develop decision-making techniques for studying runoff problems. The refinements include incorporating a sediment prediction capability using the Universal Soil Loss Equation. Other refinements reflect recent developments such as swirl concentrators. The model was tested in Lancaster, Pennsylvania. Agreement between predicted and measured hydrographs and pollutographs was only fair, due to the very limited and somewhat questionable quantity and quality verification data available. Quality predictions and the limited measured data available were reasonably close for the Conestoga River, the receiving waterway. The refined and augmented model showed an improved capability to describe the various processes. The decision-making model examines stormwater management in the general context of water resources management. It indicates that urbanization results in significantly higher peak flows and substantially increased control costs. Interrelationships with flood control and drainage, street and parking lot design, and air pollution are included. Impervious areas associated with the automobile appear to be the most important source of stormwater problems. More efficient use of paved areas appears to reduce the problem. An optimization procedure for control strategies uses linear programming techniques and procedures from cooperative N-person game theory. The SWMM was also applied to preliminary hydraulic design of sewer systems. The runoff portion provided a more accurate inlet hydrograph. The transport portion analyzed the hydraulics of flow through sewers, including a routine that checks for surcharging. (Snyder-FIRL)

WATER QUALITY MANAGEMENT PLANNING FOR URBAN RUNOFF.
Environmental Protection Agency, Washington, D. C.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-241 689, $8.00 in paper copy, $3.00 in microfiche. Report EPA-440/9-75-004, December, 1974. 214 p, 36 fig, 38 tab, 160 ref, 4 append.

Descriptors: *Waste water treatment, Analytical techniques, *Water pollution, *Water quality, *Urban runoff, Storm runoff, Runoff forecasting, Snowmelt, Storms, Surface waters, *Planning, Cities, *City planning.
Identifiers: Surface water runoff, Urban planning.

Technical assistance is provided to state and local water quality management planners for identifying and characterizing urban runoff as a non-point source of water pollution without extensive data generation. Preliminary evaluation of cost effective abatement and control practices is also discussed. The analytical procedures are identified according to three levels, requiring increasingly more effort and yielding correspondingly higher degrees of accuracy. The characterization is limited to runoff from impervious surfaces, which is the predominant source of pollutants associated with urban stormwater. Analytical procedures to predict the quality, quantity, and rate of runoff from specified storm events are included. Examples illustrate these analytical methods and procedures. Runoff from sources such as urban irrigation and snowmelt is also included. General criteria for evaluating the water pollution potential of urban runoff, as well as methods for treatment, abatement, and ultimate disposal are discussed. Background information is provided, emphasizing recent studies. (Snyder-FIRL)

MERCURY IN LAUNDRY WASTEWATERS,
Illinois Inst. for Environmental Quality, Chicago.
J. W. Patterson.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-241 602, $4.50 in paper copy, $3.00 in microfiche. ILEQ Doc. No. 75-10, February, 1975. 45 p, 22 tab, 106 ref.

Descriptors: *Waste water treatment, *Mercury, *Laundering, *Waste water(Pollution), *Pollution abatement, Detergents, Fabrics, Chemicals, Adsorption, Activated carbon, Standards, Filtration.

Results of a study directed toward identifying sources of mercury in laundry are described, and the capability and technological feasibility of available mercury abatement procedures for laundry wastes are assessed. Perhaps half or more of the mercury in laundry waste water was removed from soiled fabrics during laundering. The other major source of mercury in laundry waste water is mercury contaminated laundering chemicals. Significant mercury content was indicated for caustic, hydroflurosilicic acid, bacteriostats and mildicides, and various soaps and fabric softeners which frequently contain bacteriostatic agents. Iron and calcium chloride coagulation and activated carbon adsorption have the capability to treat effluent to meet the Illinois effluent standard of 0.5 microgram/liter. Only activated carbon, however, would consistently achieve an effluent value below the Illinois standard for the mercury levels in commercial laundry waste water. It has been shown to reduce mercury levels to below 0.25 micrograms/liter on a commercial laundry waste. Mercury abatement by substituting mercury-free laundering chemicals is also possible. Laundering chemicals can also be pretreated to remove mercury before use. Filtering caustic prior to use could possibly reduce mercury in the waste water by as much as 40%. (Snyder-FIRL)

Identifiers: *Land application.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Wheat and Romaine lettuce were grown in two different soils (calcareous and acidic) treated with a sewage sludge enriched with sulfates of cadmium, copper, nickel, or zinc to test the availability of sludge-borne heavy metals to plants. The zinc, copper, nickel, and cadmium concentrations in wheat grain grown in soil with metal additions ranging from 0-160 micrograms/gram of soil ranged from 73-185, 7.1-11, less than 1.0-119, and less than 0.1-87 micrograms/gram of wheat, respectively. The corresponding values for Romaine lettuce were: 82-1058, 6.2-8.2, 3.5-345, and 1.6-593 micrograms/gram of lettuce, respectively. Cadmium was the most toxic in terms of curtailing crop yields. The pH of the soil also affected the growth of crops and the availability of sludge-borne heavy metals to plant tissue. (See also W76-10637) (Kreager-FIRL)

WASTEWATER REUSE IN COASTAL AREAS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
F. E. McJunkin.
In: Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas, April 2-4, 1975, Wilmington, North Carolina, Unversity of North Carolina, p 111-123. 2 tab, 7 ref.

Descriptors: *Waste water treatment, *Water supply, *Water demand, *Percolation, *Injection wells, *Water reuse, Water utilization, Coasts, Saline water intrusion, Septic tanks, Aquifers, Groundwater, Industrial water.

Prospects for waste water reuse in the southeastern coastal states are discussed. The potential for direct and indirect waste water reuse is especially high in areas where municipal water supply problems exist. Such areas include the southeastern coastal communities where water demand often exceeds conventional water supplies. Reuse for industrial supply appears to offer the greatest near-term potential for increasing available water resources. One type of reuse often practiced in coastal areas is the return of septic tank effluents or other waste waters to groundwater by percolation through the soil. This leads to the possibility of returning sewage plant effluent, via percolation or well injection, to groundwater aquifers where depletion or salt-water intrusion has occurred. The technology for meeting water standards required by the majority of industrial and agricultural uses is currently available for waste water treatment, and only economics seem to limit increased waste water reuse. Data on industrial users of reclaimed municipal waste water are tabulated along with the status of technology for removing common constituents in waste water. (See also W76-11224) (Kreager-FIRL)

MAN DISCOVERS THE COASTAL ENVIRONMENT: A FOOTPRINT IN THE SAND,
North Carolina State Univ. at Raleigh. University Studies.
J. C. Wallace.
In: Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas, April 2-4, 1975, Wilmington, North Carolina, University of North Carolina, p 133-138

Descriptors: *Coasts, *Planning, *Waste water treatment, *Legislation, Land use, Administration, Federal government, State governments, Federal Water Pollution Control Act.

Poor planning practices and their effects on the southeast coastal environment are reviewed along with some recent improvements in planning. Heavily populated coastal areas without waste water treatment systems as well as areas with overloaded waste treatment systems are cited as examples of inadequate planning. Recent developments in support of more effective planning include the Federal Coastal Zone Management Act, the Federal Water Pollution Control Act Amendments of 1972, and individual actions by states such as the North Carolina Coastal Area Management Act. Some form of federal land use planning is also anticipated in the near future. (See also W76-11224) (Kreager-FIRL)

FIRST THE WATER, THEN THE SEWER, THEN LAND USE PLANNING: COASTAL PLANNING IN RETROSPECT AND IN THE NOW,
North Carolina State Planning Div., Raleigh.
J. R. Hinkley.
In: Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas, April 2-4, 1975, Wilmington, North Carolina, University of North Carolina, p 139-147.

Descriptors: *Planning, *Land use, *Coasts, *North Carolina, *Water supply, *Waste water treatment, Treatment facilities, Legislation, Industrial wastes, Domestic wastes.

Inadequacies in land use planning along the southeastern coastal area are discussed in relation to water supply and waste treatment problems. A review of residential and industrial strip development along the North Carolina coast reveals that water supply and waste water treatment facilities which were originally designed for limited services are now being overloaded by additional coastal-rural strip developments. Legislation passed by the state's general assembly to insure better land use planning in the future includes the Coastal Area Management Act and the State Land Policy Act. A Coastal Resources Commission and Coastal Resources Advisory Council have been activated to guide the formulation of land use plans in each of the state's 20 counties and their respective municipalities in the coastal area. W76-11622

IMPACT OF WATER SUPPLY AND WASTEWATER ON THE COASTAL AND MARINE ENVIRONMENTS,
North Carolina State Univ., Raleigh. Sea Grant Program.
B. J. Copeland.
In: Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas, April 2-4, 1975, Wilmington, North Carolina, University of North Carolina, p 178-187.

Descriptors: *Water supply, *Waste water treatment, *Atlantic coastal plain, *Groundwater availability, *Water reuse, Desalination, Septic tanks, Outlets, Oceans, Injection wells, Recycling, Solid wastes, Methane, Byproducts, Planning, Coasts.

Water supply and waste water treatment problems associated with southeastern coastal communities are reviewed along with the need for the development of comprehensive community planning. Potential environmental problems are discussed for the following water supply and waste water treatment alternatives: the pumping of fresh water from groundwater supplies, desalination, waste water reuse, the transport of water from other areas, the use of septic tanks, land disposal, deep-well injection, conventional waste water treatment and the disposal of waste water via ocean outfalls. The recycling of waste water through the water supply system appears to be an optimal choice for solving water problems in the coastal zone. This process also appears capable of eliminating many waste disposal problems. Solids generated by recycling processes might conceivably be used for the generation of methane gas. Journal Water Pollution Control Federation, Vol. 48, No. 4, p 688-694, April, 1976. 8 fig, 5 ref.

Descriptors: *Aeration, *Sludge treatment, *Odor, *Coliforms, *Salmoneall, *Waste water treatment, Microorganisms, Biological treatment, Temperature, Temperature control, Waste water treatment.
Identifiers: Forced aeration, Composting.

Studies investigating the use of forced aeration for composting raw waste water sludge without the release of odors are reported. Suction applied early during composting in a pile insulated with screened compost avoids the release of odorous gases to the atmosphere. Destruction of total coliforms, fecal coliforms, and salmonellae is much greater with the forced aeration method than it is with windrow composting. A survival of microorganisms in the lower corner of the pile is believed to be a result of a lack of insulation of compost depth and the resulting heat loss in this section. Most of the temperatures recorded are in the thermophilic range. Efforts are underway to achieve more uniform temperatures throughout the piles by modifying the suction system. (Kreager-FIRL)

criptors: *Waste water disposal, *Irrigation, ste water treatment, *Aeration, *Ponds, Mu-al wastes, Industrial wastes, Nitrogen, Heavy ls, Phosphorus, Solid wastes.
tifiers: Hydraulic loading, Land disposal, ess load.

use of land application for the disposal of mu-al and industrial waste water is discussed. inal disposal via land irrigation is limited r by the hydraulic or process load. The higher egree of pretreatment provided or the lower oncentration of nitrogen, the more hydraulic ng predominates as the controlling factor; eas, hydraulic load becomes insignificant dealing with waste water that has a high con-ation of any constituent that affects the plant-eceiver system. Aerated ponds can provide icant pretreatment at a very low cost. Up to nitrogen removal in pond systems appears ble with minimum horsepower requirements omplete surface agitation. Pond systems are effective for heavy metal removal if the or-waste input is high and the organic metal lex remains in the bottom sludge. It is not al-best to treat waste water to as high a degree ssible before discharge to streams because ased systems can provide a more economi-ternative. The use of land application as a tute for tertiary treatment of nitrogen, horus, metals, and solids appears to be a less expensive method of meeting current tory criteria in most areas. LOW SUBSURFACE DISPOSAL OF
EWATER,
Carolina Dept. of Natural and Economic rces. Div. of Environmental Management.
Turnage, Jr.
oceedings of the Southeastern Conference ater Supply and Wastewater in Coastal April 2-4, 1975, Wilmington, North na, University of North Carolina, p 60-67.

ptors: *Waste water disposal, *Coasts, isposal fields, *Septic tanks, *Waste water ent, *Subsurface flow, Nitrification, al, Treatment, Coliforms, Viruses, Design . Regulation.

The use of shallow subsurface systems for the disposal of waste water in coastal areas is discussed. Septic tank-nitrification line systems appear to be suitable for low-density coastal areas where the proper soil structure exists and where adequate separation from surface waters and groundwaters can be maintained. Particular attention must be paid to the possible presence of a compacted muck or vegetative layer underlying sand fills because of the likelihood of an impervious interface, resulting in the horizontal movement of effluent. Indiscriminate and unwise development where septic tank systems are used poses a potentially serious danger of contaminating the adjacent waters with fecal coliform and viruses. The introduction of treated waste water to the soil subsurface is another method of shallow disposal in coastal areas, though this method is considered mainly as an interim solution to waste disposal, pending the development of regional sewage collection and treatment systems with ocean outfalls. Regulations and design criteria for shallow subsurface systems established by the North Carolina Environmental Management Commission are outlined. (See also W76-11224) (Kreager-FIRL)

SUMMARY: TECHNOLOGICAL ALTERNATIVES FOR WATER SUPPLY AND WASTEWATER DISPOSAL IN THE COASTAL AREA,
Clemson Univ. S. C. Dept. of Civil Engineering.
B. L. Edge.
In: Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas. April 2-4, 1975, Wilmington, North Carolina, University of North Carolina, p 124-132.

Descriptors: *Waste water disposal, *Waste water treatment, *Coasts, *Oceans, Recycling, Septic tanks, Injection wells, Aquifers, Ecosystems, Chemical reactions, Water pollution effects, Technology.

Technological alternatives for waste water disposal in coastal areas are reviewed. Recycling appears to be attractive for the disposal of most wastes in coastal areas, though ocean disposal techniques that cause minimal damage to the ecosystem may be necessary for some types of wastes. Evidence indicating that life in the oceans has diminished by as much as 50% in the last 20 years, however, argues against the indiscriminate use of ocean outfalls. Subsurface waste disposal using septic tanks is considered generally unfeasible for coastal areas, particularly high-priced ocean front areas. Deep well disposal is another alternative for waste disposal in coastal areas; however, more information is required to assess the effect of high pressures and long residence times on the possible production of hazardous compounds from wastes injected into deep wells. The possible emergence of aquifers into the ocean must also be considered in terms of disrupting the ecosystem. (See also W76-11224) (Kreager-FIRL)

Identifiers: Flammable wastes, Printing industry, Black liquors.

This review of pertinent government reports, journal articles, U.S. patents, and other literature sources deals in detail with the ultimate disposal of toxic chemical, biological, radioactive, flammable, and explosive wastes from various industrial and other sources (including the graphic arts, wood, and pulp and paper industries). The topics are organized according to both origin (nature) of materials and method of disposal (land burial, landfill, ocean discharge, deep wells, incineration, biological and chemical degradation, and pretreatments for ultimate disposal). Among paper-industry wastes discussed are black liquors, spent

An experimental landfill for paper mill sludge rich in ash (mineral elements) was constructed and monitored to obtain engineering data essential for development of guidelines and recommendations for the design and operation of future landfills for solid paper mill wastes. Construction of the landfill is described, and physical properties of the sludge are summarized. Consolidation and settlement during the first year and movements within an excavated slope during the second year were closely monitored. The field behavior of the sludge during consolidation and after slope excavation was analyzed, using theories from geotechnical engineering. The primary compression of the sludge was very rapid, suggesting that preloading can be an effective way for stabilization and minimizing long-term settlements. Low sludge unit weight plus high stability of the consolidated sludge makes it suitable as a light weight fill material for embankments. The high shear strength of the consolidated sludge suggests that the landfill could be contoured to provide recreational areas, etc. Proper placement of sand or gravel blankets and/or tile drains will shorten the drainage time within the sludge, thereby reducing the time needed for primary consolidation. The drains could also be utilized to collect the leachate for subsequent treatment, to protect groundwater, etc. (Sykes-IPC)

Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 101, p 469-473, 1975. 2 fig, 6 ref, 1 tab.

Descriptors: *Sludge, *Pulp wastes, *Concrete additives, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Sludge disposal, Water pollution control, Compressive strength, Concretes, Portland cements, Michigan, Ultimate disposal, Waste disposal, Recycling.
Identifiers: Groundwood mills, Kraft mills.

As an initial investigation into the effect of a pulp and paper mill sludge on the compressive strength of concrete, a series of tests were conducted on concrete mortar cubes prepared with four different amounts of sludge, three water/cement ratios and ffour curing times. The sludge used as the additive was obtained from an integrated groundwood/kraft pulp and paper mill in Upper Michigan. The sludge was dried and ground until it passed a No. 100 standard sieve. The addition of 0.5% dried paper mill sludge to portland cement did not reduce the compressive strength of the concrete, but additions of 1 and 1.5% reduced the strength up to 20%. (Buchanan-IPC)

U.S. Patent No. 3,956,126, 6 p, 4 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 946, No 2, p 731, May 11, 1976.

Descriptors: *Patents, *Domestic wastes, *Industrial wastes, *Organic wastes, *Water pollution sources, *Waste disposal, Evaporation, Heat exchangers, Incineration, Condensation, Water reuse, Equipment.
Identifiers: Combustion, Internal combustion engine.

The invention provides an apparatus or system for efficiently disposing of organic waste materials, including sewage and garbage. The waste material is directed to an evaporator where the liquid content of the waste material is evaporated by the use of a suitable heat exchange medium. The heat exchange medium is heated by exhaust gases from an internal combustion engine, and also by the heat of combustion developed by burning in the hot exhaust gases from the engine, substantially all of the solid residue remaining in the evaporator after the water has been removed. The liquid from the evaporator is recondensed and can be recycled for re-utilization or can be discharged if desired. The products of combustion constitute a small amount of ash and carbon dioxide and can be discharged to the atmosphere from the exhaust pipe of the engine. (Sinha-OEIS)

Environmental Protection Agency, Atlanta, G Region IV.
D. R. Hopkins.
In: Proceedings of the Southeastern Confere on Water Supply and Wastewater in Coa Areas, April 2-4, 1975, Wilmington, No Carolina, University of North Carolina, p 27-34

Descriptors: *Waste water disposal, *Outf *Permits, *Legislation, *Oceans, *Coa *Florida, Atlantic coastal plain, Effluents, Wa water treatment, Legal aspects, Evaluation.
Identifiers: Federal Water Pollution Control Amendments.

Federal criteria for the issuance of ocean dispo permits for waste outfalls are reviewed along w Environmental Protection Agency studies of potential impact of ocean outfalls in south Florida. The Federal Water Pollution Control Amendments of 1972 establish criteria for the suance of permits for ocean discharges based the following considerations: the environme effects of the proposed waste disposal operat the need for ocean disposal, alternatives to oc disposal, and the effect of the proposed actio aesthetic, recreational, economic, and o values associated with the ocean. The criteria with the evaluation of individual permit appl tions on a case-by-case basis from informa supplied by the applicant concerning the cha teristics of the waste and the effect of the w water on the receiving environment. An Envi mental Protection Agency study of alterna waste water disposal methods in southeast Flo concludes that disposal of secondary treated w water to the ocean via outfalls is a viable me of disposal for the area. ifiers: Safe Drinking Water Act.

se of deep-well injection for the disposal of water and the preservation of usable dwater supplies is discussed. The use of injection wells for the storage of treated water in salt water aquifers can in some provide a twofold benefit: potentially harm- ruses and bacteria that might survive secon- treatment are removed from man's environ- and the injected fresh waste water displaces er quality (salty) groundwater, thus creating reserve of usable water in underground e. Along many coastal areas in particular, eavy withdrawal of potable groundwater resh-water aquifers is causing salt water en- nment inland into the aquifer system; and, in cases, treated waste water may be injected e aquifer system to create a hydraulic barri- hold back the encroaching salt water. Regu- s of the Safe Drinking Water Act which deal e protection of groundwater from the injec- f wastes into the ground are reviewed along nvironmental Protection Agency policies on reuse. 5F. Water Treatment and Quality Alteration

DEBATE GROWS OVER WATER PURIFICATION METHODS.
Chemical and Engineering News, Vol. 54, No. 26, p 34, 39, June 21, 1976.

Descriptors: *Waste water treatment, *Treatment facilities, *Water purification, *Disinfection, Viruses, Coliforms, Chlorination, Water quality standards, Ozone.

Criteria for achieving disinfection of water and waste water were discussed at a forum sponsored by the International Ozone Institute. Waste water disinfection has been defined as the reduction of virus and fecal coliform bacteria concentrations to acceptable levels. In the United States, chlorination of waste water is the predominant treatment method, and laws require chlorine residuals in treated waters. An amendment, proposed in August 1975, would delete coliform bacteria limitations and instead require EPA to determine disinfection according to water quality standards. An important chlorine alternative is ozonation. Possibilities for converting chlorination treatment facilities are discussed. In the United States, an ozone treatment project has been operating since 1971 at Blue Plains, near Washington, D.C. Estes Park, Colorado and Cleveland, Ohio, have also adopted ozonation. (Kramer-FIRL)

BIN ACTIVATORS RELIABLY FEED LIME AND DIATOMACEOUS EARTH IN WATER TREATMENT FACILITY.
Pollution Engineering, Vol. 8, No. 6, p 14, 18, June, 1976. 1 fig.

Descriptors: *Treatment facilities, *Water treatment, *Lime, *Diatomaceous earth, *Automation, Sludge disposal, Sludge, Mechanical equipment.
Identifiers: *Bin activators.

An automated system to feed diatomaceous earth and pebble lime assures that a filter washwater and alum sludge disposal facility installed by Passaic Valley Water Commission (PVWC) at their Little Falls Water Treatment Plant in Totowa, New Jersey, will operate successfully. The new plant eliminates the discharge of 20 tons of sludge a day into the Passaic River and enables PVWC to meet the 1985 Federal zero discharge requirements. The new facility, which utilizes sludge presses, requires uninterrupted flow of diatomaceous earth and lime to the dewatering system from storage bins. Approximately 6500 and 1100 lb of pebble lime and diatomaceous earth, respectively, are fed to the system daily. To eliminate possible flow problems, four Vibra Screw Bin Activators were installed on the storage bins. Lime is discharged to slakers, at the rate of 1000 lb/hr, through 8-in. diameter discharge outlets on three of the activators. The other Bin Activator discharges 400 cu ft/hr of diatomaceous earth to a heavy duty feeder. The Bin Activator is vibrated and replaces a static bin bottom, removing the compaction area where flow problems originate. The feeder is a rugged volumetric screw feeder whose trough and feed screw vibrate. Vibration of the trough maintains uniform density and insures complete filling and emptying of each of the screw's flights. Feeder output is determined by screw speed and is controllable to better than 1% accuracy. (Snyder-FIRL)

In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 179-198. 2 fig, 6 ref.

Descriptors: *Disinfection, *Potable water, *Chlorination, *Water purification, Water treatment, Treatment facilities, Groundwater, Surface waters, Water supply.
Identifiers: Free residual chlorination, *Dechlorination, Ammoniation, Chloramination.

Methods for the disinfection of potable water supply sources obtained from both surface and subsurface supplies are discussed, with particular emphasis on chlorine disinfection practices in Ontario, Canada. The following disinfection practices are reviewed: plain chlorination, free residual chlorination, free residual chlorination followed by dechlorination, and chloramination. In general, only plain chlorination is employed for disinfection of potable water supplies throughout Ontario, although Toronto is using free residual chlorination followed by dechlorination at its older plants and free residual chlorination and dechlorination followed by ammoniation at recently constructed facilities. Recently, a trend has been initiated for the adoption of compulsory free residual chlorination at all installations throughout Ontario. (See also W76-11249) (Kreager-FIRL)

AUTOMATED FLUORIDATION USING A SELECTIVE ION ELECTRODE,
Peterborough Utilities Commission, Peterborough, Ontario, Canada, Filtration Plant.
W. Manley.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 200-209, 2 fig, 5 ref.

Descriptors: *Fluoridation, *Potable water, *Analytical techniques, *Monitoring, *Fluorides, *Electrodes, Automatic control, Equipment, Automation, Water treatment, Pumps, Treatment facilities, Pollutant identification.
Identifiers: *Selective ion electrodes.

The use of selective ion electrode systems for monitoring fluoride ion concentrations and controlling the fluoride residual in drinking water supplies is discussed. Unlike colorimetric methods of fluoride measurement, very few physical or chemical interferences occur with the fluoride selective ion electrode. There is no need to dechlorinate or remove the turbidity or color from the sample being measured, and no time-consuming distillation is required. Hydroxide interference can be eliminated by the use of total ionic strength buffers which also provide a high ionic strength background, thereby swamping out variations in sample ionic strength. A continuous analysis and control system for maintaining the proper fluoride residual is outlined. The system utilizes a selective ion electrode in combination with a duplex pump whose stroke length varies in accordance with signals received from the analyzer so that the desired fluoride residual is maintained. PRE-TREATMENT OF WATER SUPPLIES UTILIZING FERRIC CHLORIDE,
Westerly Filtration Plant, Toronto (Ontario). Quality Control Office.
J. A. Carnduff.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 211-227. 9 tab, 7 ref.

Descriptors: *Coagulation, *Water purification, *Iron compounds, *On-site investigations, Feasibility studies, Chemical reactions, *Water treatment, Performance, Evaluation, Costs, Economics, *Pre-treatment(Water).
Identifiers: Ferric chloride, Alum, Aluminum sulfate, Coagulants.

Laboratory, pilot plant, and field tests were conducted to determine the feasibility of using ferric chloride as a substitute coagulant for alum during water treatment operations. The chemical reactions of coagulation in which iron salts react with water to form floc are similar to those of aluminum sulfate, with the main reaction in both instances being between the metal salt and the natural alkalinity in the water to produce complex hydrous oxide compounds. Pilot plant studies established that ferric chloride can be applied in dosages up to 10 ppm in high rate filters operating at rates up to 4 grams/min/sq ft. Tests at a water treatment plant using 1 ppm of ferric chloride showed satisfactory results; increasing the dosage up to 6 ppm only decreased the filter run length while maintaining the same quality of filtered water. The iron in the filtrate was usually less than 0.015 ppm, with only one run exceeding 0.050 ppm. The dosage of ferric chloride required to produce results comparable to those obtained with alum was generally half that for alum addition. A comparison of the costs of ferric chloride versus alum reveals that significant savings can be realized by using ferric chloride as a substitute coagulant. (See also W76-11249) (Kreager-FIRL)

MAINTENANCE MANAGEMENT OF WATER-WORKS SYSTEM,
Thorne Riddell Associates Ltd., Toronto (Ontario).
J. L. Smith.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 249-253. 1 fig.

Descriptors: *Water treatment, *Water works, *Maintenance, *Planning, *Budgeting, *Management, *Treatment facilities, Repairing, Maintenance costs, Equipment, Costs.

A system of maintenance management for water works is outlined. The system is designed so that a budget developed will be based not solely on historical data but also on the requirements and capabilities as provided by the level of service and productivity. Basic information required before a work plan and budget can be achieved includes: an inventory of the facilities to be maintained, desired performance standards, the required level of service, and reporting procedures for establishing productivity standards. Financial data can then be added to the above information to develop unit costs (for example, cost per mile of pipe repaired). Benefits gained by establishing a maintenance management program for water works include: the provision of a standard level of service to all people being served by the system, the establishment of an annual work schedule to take into account predicted peaks and lows in work load, and the avoidance of duplication by planning and allocating work in advance. METROPOLITAN TORONTO'S APPROACH TO PREVENTATIVE MAINTENANCE FOR TREATMENT PLANTS,
Metropolitan Toronto Dept. of Works, (Ontario). Water and Pollution Control Directorate.
E. H. Baldock.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 332-346. 8 fig, 1 tab.

Descriptors: *Maintenance, *Treatment facilities, *Water treatment, *Computer programs, Equipment, Repairing, Instrumentation, Canada, Costs.
Identifiers: Inventories, Toronto.

A pilot-scale, computerized equipment maintenance and inventory system being used at water treatment plants in metropolitan Toronto is described. Each piece of equipment being maintained is numbered so that data on its condition can be stored in a computer. The data stored include a cost inventory of all units, a preventative maintenance schedule of all components of the equipment, and a history of the maintenance work which includes the man hours of work performed. The maintenance cycle is a function of the operating hours of each piece of equipment, and this information is fed into the computer on a regular basis. The computer prints out on a weekly basis a list of components to be serviced that week. Upon completion of the task, the workman then records the updated condition of the repaired equipment. Formats used for recording the above data are illustrated. (See also W76-11249) (Kreager-FIRL)

THE TREATMENT OF WATER PURIFICATION PLANT WASTES,
Gore and Storrie Ltd., Toronto (Ontario).
R. A. G. Simmons, and A. J. Bowers.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 404-429. 6 fig, 1 tab, ref.

Descriptors: *Water purification, *Waste treatment, *Waste disposal, *Cost analysis, *Land use, Landfills, Sewerage, Filtration, Freezing, Lagoons, Drying, Byproducts, Recycling, Centrifugation.
Identifiers: Water treatment wastes

Various methods for the treatment and disposal of water purification plant wastes are reviewed. Topics covered include: waste reduction by reducing water usage or implementing process changes; waste collection and centralization; and treatment and disposal options such as barging to sea, lagooning, sand bed drying, discharge to sanitary sewers, freezing, vacuum filtration, centrifugation, filter pressing, and coagulant recovery. Pressure filtration, lagooning, and disposal to sewers systems are cited as the most probable solutions to waste problems resulting from water purification activities. Alternative final disposal sites are also discussed and include: sanitary landfill sites, specially selected non-agricultural sites, and agricultural land. A cost analysis of alternative waste treatment and disposal processes is presented. (See also W76-11249) (Kreager-FIRL)

AUTOMATED POND WATER TREATMENT UNIT,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
C. E. Rice, J. E. Garton, and L. Jarrell.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 [illegible], $3.50 in paper copy, $3.00 in microfiche. Completion Report, (1976). 16 p, 7 fig, 1 tab, 1 ref. OWRT A-060-OKLA(1).

Descriptors: *Water treatment, Ponds, *Filtration, *Pumps, Storage tanks, Waste water treatment, *Pumping, Chlorine.
Identifiers: Rural water supply, Upflow filtration, *Sand filters, Backflushing, Alum.

An automated pond water treatment unit was designed, constructed and evaluated. It was designed as an exterior unit to be located in the vicinity of a pond or lake. The unit was self-contained and furnished filtered and chlorinated water under pressure. The unit consisted of a pond water pump, chlorine and alum solution containers with metering pumps, a sand filter, a time clock and solenoid for backflushing, storage for treated water and a water pressure pump and storage tank. The sand filter was an upflow type which permitted the floc to settle out and be removed by backflushing. The pond water pump had a capacity of nine gallons per minute (34 liters per minute) and the pressure pump a capacity of about [illegible] gallons per minute (30 liters per minute). The unit was located at Hams' Lake, a flood detention reservoir that usually had fairly clear water. Tests with the units showed that it was not filtering water properly so modifications were made. At first the solenoid value restricted the backflush flow too much so it was removed and a gate valve installed for manual operation. Additional tests suggested other minor changes. After these modifications and changes, the unit produced a good quality water.

criptors: *Patents, *Water treatment, *Waste er treatment, *Water purification, *Water lity, Filtration, Filters, Equipment, Nozzles, ins.
ntifiers: Filtration systems, Filter media, kwashing.

er-filtration systems of the gravity type are loyed for filtering high volumetric flow rates quids in municipal and industrial water treat- t and waste treatment plants. The filtration em comprises one or more filters, each em- ing a bed of finely-divided granular filter ia for filtering a liquid as it seeps downward ugh the filter bed. After a number of hours of ation, it becomes necessary to wash the bed of media in order to remove the material ed. Washing is accomplished by pumping r under pressure through the conduit in rse direction into the system of fluid ageways in the underdrain system, and then rd through the perforations in the underdrain into the overlying bed of filter media. The washing operation must be performed care- to avoid disturbing or damaging the bed by ing channels or 'blow holes'. The object of nvention is to overcome the problem of form- low holes during backwashing and to improve istribution of wash water to insure effectively ing all areas for shorter periods of time. Each rdrain unit is provided with nozzles in the r wall. The cooperating nozzles in each group o oriented so as to direct streams of wash into impingement with each other outside lter underdrain unit to disperse the streams of water and reduce its velocity. CERTAIN ASPECTS OF THE PROCESS OF ENTEROVIRUS INACTIVATION WITH CHLORINE, (IN RUSSIAN),
Institute of General and Municipal Hygiene, Moscow (USSR)
E. L. Lovtsevich.
Gig Sanit 38(10), p 11-15, 1973.

Descriptors: *Chlorine, *Chlorination, *Viruses, Enteric bacteria, Water treatment, Water pollution.
Identifiers: *Enterovirus, *Poliovirus.

An experimental study of poliovirus inactivation during water chlorination showed that C1-inactivated virus could not be reactivated. The amount of residual C1-present in water of water pipe did not inactivate virus introduced into water as a result of secondary contamination. The process of virus inactivation with C1- did not depend exponentially on the time of C1-action. The part of the virus population (0.5-1%) that was more resistant to C1-, was not genetically different from the main part of the virus population; it did not consist of biologically active RNA and probably was formed by aggregations of virus particles.--Copyright Biological Abstracts, Inc. 1976.

GROUNDWATER SUPPLIES OF THE COASTAL REGION,
H. E. LeGrand.
In: Proceedings of the Southeastern Conference on Water Supply and Wastewater in Coastal Areas, April 2-4, Wilmington, North Carolina, University of North Carolina, p87-101. 3 fig,16 ref.

Descriptors: *Water supply, *Groundwater resources, *Saline water intrusion, *Aquifers, *Coasts, Water pollution effects, Water mangement(Applied), Wells, Septic tanks.

Problems associated with the quality and availability of groundwater supplies along the east coast are reviewed. Groundwater suitable for domestic water supplies occurs at shallow depths throughout the coastal region, though pollution from septic tanks and other sources of manmade pollution is becoming a serious problem in developed areas. The tertiary limestone aquifer along the east coast is one of the most productive aquifers in the world; however, concentrated pumping in certain areas is causing salt water encroachment of this artesian source. Salt-water encroachment in artesian sand aquifers is not yet a serious problem, but excessive concentrated withdrawal of groundwater from these sources may lead to serious salt water problem in the future. A groundwater management policy involving the salvaging of water dicharged naturally into the sea and estuaries, the selective dispersion of centers of well water withdrawal, and the careful management of waste disposal practices is recommended. MARGINAL POLLUTION ANALYSIS FOR LONG RAGE FORECASTS,
Cornell Univ., Ithaca, N. Y. Center for Urban Development Research.
W. Isard, F. J. Cesario, and T. A. Reiner.
Regional Science Dissertation and Monograph Series No. 4, Center for Urban Development Research, Cornell University, Ithaca, New York, June 1975. 529 p, 31 fig, 133 tab, 113 ref, 14 appen.

Descriptors: *Methodology, *Forecasting, Effects, *Water pollution, *Air pollution, *Solid wastes, Industrial wastes, Domestic wastes, Transportation, Economics, Human population, Regional analysis, New York, Mathematical models, Systems analysis.
Identifiers: *Urban regions.

A practical method for forecasting the implications of growth for marginal (additional) pollution--air, water and solid waste--has been developed

UNIV. OF ILL. URBANA-CHAMPAIGN

with reference to various kinds of urban regions. The analysis framework explicitly recognizes the interrelated nature of the pollution generated by industrial, household and transportation sources. Two submodels compose the framework: (1) an industrial-household emissions submodel; and (2) a transportation emissions submodel. These submodels are fully operational and can be used at low cost to test and examine the pollution implications of a wide variety of assumptions on the nature and direction of economic and population growth on a regional or subregional basis. The submodels were applied to a representative set of seven urban regions to test the different effects of age, size, pollution control technology, and urban form in a marginal growth context. Included in this set were five existing New York State urban regions and two prototype, hypothetical cities. The importance of the transportation sector in marginal pollution analysis was clearly established. A method was developed for examining the transportation emissions implications which are both direct and indirect. This study resulted in considerable advances in data collection, analysis and management. Its analysis framework can be used for a variety of purposes in the formulation of environmental policy. A MATRIX APPROACH FOR DETERMINING WASTEWATER MANAGEMENT IMPACTS,
Weston (Roy F.), New York.
K. J. Phillips, and J. A. DeFilippi.
Journal of the Water Pollution Control Federation, Vol. 48, No. 7, p 1759-176, July 1976. 5 fig, 3 tab, 4 ref.

Descriptors: *Waste water(Pollution), *Management, Evaluation, Project planning, Equations, Systems analysis, Methodology.
Identifiers: *Matrix approach, *Environmental impact.

A methodology is developed and demonstrated to quantify and rank the relative environmental impacts of alternative wastewater management systems. The approach first identifies and objectively assigns weights to various environmental categories. Project components are then listed and relative environmental impacts are calculated for each environmental category by using functional relationships. The results are incorporated into a matrix and a final relative environmental impact is numerically calculated for each alternative. The approach was initially developed for water resources projects, but it has been modified and adopted to evaluating wastewater management systems. (Bell-Cornell)

COST SHARING TO INDUCE EFFICIENT TECHNIQUES OF ABATING WASTEWATER POLLUTION,
National Bureau of Standards, Washington, D.C., Building Economics Section.
H. E. Marshall, and R. T. Ruegg.
Journal of Environmental Economics and Management, Vol. 2, No. 2, p 107-119, December 1975. 5 tab, 3 equ, 13 ref.

Descriptors: *Waste water(Pollution), *Cost sharing, *Pollution abatement, *Water quality control, Evaluation, Effects, Measurement, Equations, Operation and maintenance, Costs, Optimization, Constraints, Systems analysis.
Identifiers: Bias, Least-cost, Benefit maximization.

This paper analyzes existing cost-sharing rules for wastewater pollution grants administered by the Environmental Protection Agency under the 1972 Amendments to the Federal Water Pollution Control Act. It identifies and measures biases in the existing cost-sharing rules that encourage nonfederal interests to select particular techniques (e.g., capital-intensive techniques) over others even when the selected techniques are not the least costly to the nation. The paper develops theoretically a cost-sharing condition -- that the same percentage cost share be applied to all abatement techniques -- that would eliminate the cost-sharing bias. Alternative cost-sharing approaches are evaluated in terms of their biasing effects and their absolute dollar costs for federal and nonfederal project participants. In conclusion, existing rules for the cost sharing of wastewater pollution abatement appear to bias nonfederal interests toward particular techniques, expecially construction-intensive over operation and maintenance and land site-intensive techniques. ESTIMATED COSTS OF MECHANICAL CONTROL OF WATER HYACINTHS,
Georgia Univ., Athens. Dept. of Agricultural Economics.
M. J. Mara.
Journal of Environmental Economics and Management, Vol. 2, No. 4, p 273-294, April 1976. 2 fig, 6 tab, 24 ref.

Descriptors: *Water hyacinths, *Water quality control, *Harvesting, *Dynamic programming, *Linear programming, Optimization, Constraints, Biology, Lakes, Size, Equations, Control, Marginal costs, Costs, Mathematical models, Systems analysis.
Identifiers: *Cost minimization, Infestation, Mechanical control, Control strategy, Operating policy.

Water hyacinths are detrimental to the environment in many ways, directly or indirectly affecting all people living in or using an area infested by the weeds. Presented is an application of dynamic linear programming for purposes of achieving the minimum cost strategy for the mechanical harvesting method of controlling water hyacinths in Florida. The optimization model was developed and applied to a hypothetical lake to determine the least-cost method and seasonal pattern of removal to attain specified levels of control. Results indicate that for a 400-acre lake under specified conditions, the annual costs of controlling water hyacinths run to $13,500 or $33.75 per acre. These costs increase as the initial amount of infestation from which geometric growth of the biomass occurs and/or the size of the water body increases. (Bell-Cornell)

DYNAMIC MODELLING AND CONTROL APPLICATIONS IN WATER QUALITY MAINTENANCE,
Cambridge Univ. (England). Dept. of Engineering.
M. B. Beck.
Water Research, Vol. 10, No. 7, 1976, p 575-595. 4 fig, 13 equ, 51 ref.

Descriptors: *Water quality control, *System analysis, *Hydrologic aspects, Technology, Instrumentation, Management, Rivers, Mathematical models, Operations research, Estimation, Equations, Water supply, Water distribution(Applied), Treatment facilities, Waste water treatment, Sewers, Networks, Urban runoff, Dissolved oxygen, Biochemical oxygen demand, Flow.
Identifiers: Biological processes.

A unified, systematic approach to problems of water quality management has been developed. A water quality system is defined as the following group of component features: the abstraction, purification, and supply of potable water from a river; consumer effluent, rainfall-runoff from the urban land surface, and the sewer network; the wastewater treatment plant; and the river itself. A systems analysis approach to the study of the dynamic and control aspects of the system is discussed, with particular reference to the practical limitations of instrumentation and technology. In an attempt to blend the theory with the practice, recent studies on the dynamic modeling and control of parts of the water quality system are reviewed. Special attention is paid to the practical application of techniques of system identification and parameter estimation. Finally, pieces together several individual results, it is possible to give a good indication of the manner in which control studies should be directed in the near future. It is concluded that of the modeling problems still remaining, the outstanding challenge to the dynamic systems analyst is that of biological process modeling: more attention must be given to the achievement of a proper understanding of, for example, the substrate/micro-organism relationships of activated sludge and anaerobic digestion as applied to river water quality. VILLAGE WATER SUPPLY, A WORLD BANK PAPER.
International Bank for Reconstruction and Development, Washington, D. C.
March 1976. 96 p, 19 tab, 14 ref.

Descriptors: *Water supply, *Rural areas, *Water quality, *Public health, Economics, Management, Investment, Projects, Water resources development, Costs, Benefits, Planning, *Domestic water, Water quality standards.
Identifiers: *World Bank(Washington D. C.), Developing countries, Villages.

The supply of water for domestic use in the rural areas of the developing world is considered. The rate at which access to safe water is being provided for these populations is too slow to keep pace with the birth rate. In these countries, water-borne or water-related diseases are among the three major causes of sickness and death. The World Health Organization considers that provision of a safe and convenient water supply is the single most important activity that could be undertaken to improve the health of people living in rural areas. The World Bank has been shifting the emphasis of its lending program so as to have greater impact on the rural population through projects in agriculture and integrated rural development; rural water supply and sanitation should be a significant component of these projects. Because rural water supply has hitherto been largely neglected, experience and knowledge are lacking to set specific targets for action. As a first step this paper concentrates on the problems peculiar to this subsector and suggests ways to begin to overcome the current state of neglect. (Bell-Cornell)

blished well and dispersed widely. Most
weeds suffered heavy feeding damage;
growing on the flats did not seem suita-
a beetles because the weeds dried up
awdowns or were flooded during high
tural factors limiting flea beetle popula-

tions are climatic. Frost eliminates the host plant's serial portions on which beetles feed, so populations are limited and insufficient beetles are present when the plant's growth cycle is most susceptible. Rapid water level change from rainfall and hurricane intensity winds are other abiotic factors. Water hyacinth was controlled by spraying with amine salts of 2,4-D. The butoxyethanol ester of 2,4-D was used in potable water sources. Spraying when crop production was at a minimum reduced damage from drifting. There were generally no harmful effects from control operations on water supplies. Aerial applications are made with concentrated formulations in invert emulsions or similar carriers to prevent drift. After initial clearing, maintenance may needed yearly for 4-5 years. When practicable, vegetation can be cut from anchorage and allowed to drift to salt water. (See also W76-11145) (Buchanan-Davidson--Wisconson)

FUNDAMENTALS OF DRIFT CONTROL BY DROPLET SIZE SELECTION,
Hercules Powder Co., Wilmington, Del. Synthetics Dept.
L. O. Hill.
In: Aquatic Plant Control Program: Integrated Control of Alligator Weed and Water Hyacinth in Texas, Army Engineer Waterways Experiment Station, Vicksburg, Miss., Technical Report No. 9, March 1975, p. D3-D8. 8 tab.

Descriptors: *Weed control, *Pesticide drift, *Drops(Fluids), *Herbicides, 2,4-D, Stoke's Law, Particle size, Application equipment, Application methods, Rates of application, Sprays, Emulsions.

Although 2,4-D is a very active, selective weed killer, it has caused much damage, largely due to drift. Droplet drift is the distance a crosswind will blow it in the time the droplet is falling. Stoke's Law can be used to predict drift, calculate rate of application, and determine the time it takes different droplet sizes to fall depending on crosswind speed and height it is sprayed from. Although larger particles drift less, droplet size also determines covering ability. Droplets large enough to contain drift but small enough to spray the required number of droplets per square inch to kill are generated by a bifluid spray system. No premixing is required as the herbicide concentrate becomes the oil phase. The nozzle contains the mixing chamber the energy created by swirling action inherent in the nozzle design inverts the emulsion from the water to the oil phase. This water-in-oil emulsion exhibits a plastic-type rheological behavior with a yield point of about 100 g's, which prevents further breaking once spherical droplets are formed. The invert droplet reduces water evaporation while the droplet is falling to the ground. Use of helicopters, fixed-wing airplanes, backpack sprayers, tractors, and blowers give great versatility to this spray system. (See also W76-11145) (Buchanan-Davidson--Wisconsin)

NEW TECHNIQUES IN VEGETATION MAINTENANCE ON MILITARY RESERVATIONS,
Stull Chemical Co., San Antonio, Tex.
D. P. Petersen, O. H. Hayes, and C. R. True.
In: Aquatic Plant Control Program: Integrated Control of Alligator Weed and Water Hyacinth in Texas, Army Engineer Waterways Experiment Station, Vicksburg, Miss., Technical Report No. 9, March 1975, p. E3-E12. 5 tab.

Descriptors: *Aquatic weed control, *Herbicides, *Brush control, *Weed control, *Grasses, *Emulsion, 2,4-D, Dalapon, Adjuvants, Spraying, Toxicity, Alligatorweed, Water Hyacinth, Pondweeds, Pesticide drift, Rates of application, Application equipment.
Identifiers: *Stull Bifluid System, Dicamba, Monosodium-methanarsonate, Bromacil, Ammonium sulfamate, Duckweed.

The Fourth Army uses water-in-oil (invert) herbicide emulsions for grounds maintenance containing either 2,4-D, dicamba, dalapon, monosodium-methanarsonate, bromacil, or ammonium sulfamate mixed with spray adjuvant plus diesel oil. Toxicant dose rates of some herbicides may be reduced because of greater confinement of spray to the target. Ammonium sulfamate and monosodium-methanarsonate in an invert emulsion base gives general vegetation control without soil contamination. It is effective on woody plant growth when applied heavily along fence lines and around buildings, poles, trees, etc. The Stull Bifluid System using adjuvants with phenoxy herbicides to control aquatic emergent weeds (alligator weed, duckweed, pondseed, water hyacinth) causes little water contamination and drift and the maximum amount of active herbicide is concentrated on target weeds. Single applications of phenoxy herbicides on susceptible emergent aquatic weeds were enough, but species susceptibility differed. Low volatile emulsifiable concentrates are recommended. Minimum application rates with small droplets should be used when drift is minimal, but maximum rates with large droplets should be used when drift is critical. How to select herbicide dose rates, water and oil premixes, and water to oil ratios; calculation of sprayer outputs; of metering orifices; and calibration of sprayers is shown. W76-11149

HERBICIDES AS ANTIPOLLUTANTS,
Agricultural Research Service, Laramie, Wyo. Crops Research Div.
F. L. Timmons.
In: Aquatic Plant Control Program: Integrated Control of Alligator Weed and Water Hyacinth in Texas, Army Engineer Waterways Experiment Station, Vicksburg, Miss., Technical Report No. 9, March 1975, p. F3-F19. 7 tab.

Descriptors: *Aquatic weed control, *Herbicides, *Algal control, *Riparian plants, Copper sulfate, Potable water, Diquat, Sodium arsenite, 2,6-Dichlobenil, Monuron, Safety, 2,4-D, Submerged plants, Floating plants, Fish, Pesticide residues, Resistance, Irrigation water, Toxicity, Dalapon, Persistence, Agronomic crops, Hydrosols(Soils).
Identifiers: Dichlone, Acrolein, Endothall, Xylene, Petroleum oils, Fenac, Diuron, Ammonium sulfamate, Bromacil, Sodium TCA, Silvex.

Approximately 150 different aquatic or water weeds are considered pollutants; many convert inorganic nutrients into organic matter, remove carbon dioxide, add dissolved oxygen to water, are food sources or provide suitable habitats for fish, etc. Aquatic plant growth, density, vigor, and nutrient concentrations are increasing in most areas and causing problems. Twenty herbicides are registered for control of aquatic and bank weeds: copper sulfate and dichlone for algae; acrolein, diquat, endothall, petroleum distillate, sodium arsenite, dichlobenil, fenac, diuron, monuron, and ester formulations of silvex and 2,4-D for submersed seeds; diquat, silvex, and 2,4-D for floating aquatic weeds; and ammonium sulfamate, bromacil, dalapon, sodium TCA petroleum oils, silvex, and 2,4-D for emersed, marginal, or bank weed control. The amount and persistence of herbicide residues in water and fish can determine if a herbicide is a pollutant. Results on the persistence of 2,4-D, diquat, endothall, dichlobenil, fenac, and silvex in water and fish are presented. Studies are being conducted on herbicide residues in water, hydrosoil, and irrigated crops, their toxicities to animals and humans, and the presence and fate of possible harmful degradation products. AQUATIC PLANT CONTROL PROBLEMS AT SAM RAYBURN RESERVOIR,
Army Engineer District, Fort Worth, Tex.
E. Mayer.
In: Aquatic Plant Control Program: Integrated Control of Alligator Weed and Water Hyacinth in Texas, Army Engineer Waterways Experiment Station, Vicksburg, Miss., Technical Report No. 9, March 1975, p. H3-H11. 1 fig.

Descriptors: *Aquatic weed control, *Herbicides, *Texas, Water hyacinth, Alligatorweed, 2,4-D, Emulsions, Spraying, Mosquitoes, Reservoirs, Biocontrol, Economic impact.
Identifiers: Silvex, Agasicles hygrophila, *Sam Rayburn reservoir(Tex).

The Town Bluff Dam-B. A. Steinhagen Lake and the Sam Rayburn Reservoir, Texas, have serious problems with water hyacinth and alligator weed growth. The proposed control program will consist of an initial treatment in the fall, with concentrated treatment in the spring, and follow-up treatment later. The most efficient control agent appears to be 2,4-D; the alligator weed flea beetle has helped but not enough for complete control. It has been proposed to use a water solution of the amine salt or butoxyethanol ester of 2,4-D to control water hyacinth at both reservoirs (3000 acres) and an isoctyl or low volatile ester formulation of 2,4-D-trichlorophenoxyacetic acid (silvex) as a conventional spray or invert emulsion from rotary aircraft for alligator weed control in the B.A. Steinhagen Lake (1000 acres) in 1975. Control of these weeds would help prevent breeding of mosquitoes, make lakeside areas useable, prevent flooding caused by hyacinth mats, and increase recreational use. Use of herbicides should not cause safety hazards. Concentration of the chemicals should not occur. Usually these chemicals have not caused fish kills or decreased fishing success. COST BENEFIT ANALYSIS AND WATER POLLUTION POLICY.
Urban Inst., Washington, D.C.
Environmental Protection Agency and Urban Institute Symposium, September 5-7, 1973, Annapolis, Md. H. M. Peskin and E. P. Seskin, editors. Published in 1975, 370 p, URI 77000. $5.95.

Descriptors: *Water pollution control, *Econometrics, *Cost-benefit analysis, *Theoretical analysis, *Evaluation, *Measurement, *Estimating, Water quality standards, Indirect benefits, Direct benefits, Intangible benefits, Intangible costs, Costs, Indirect costs, Institutional constraints, Industrial wastes, Environmental effects, Project benefits, Comprehensive planning, Future planning(Projected), Risks, Analytical techniques.

This volume contains the contributions to a symposium sponsored by the Environmental Protection Agency concerning the major problems involved in environmental cost-benefit analysis, together with a comprehensive editorial overview of its basic concepts. Discussions in Part One relate to the concepts of benefits in cost-benefit analysis with emphasis on water pollution control; a survey of the techniques for measuring the benefits of water quality improvement; institutional and conceptual thoughts on benefit studies. Part Two relates to cost methodology and measurement as detailed in costs of water quality improvement, transfer functions, and public policy; environmental policy costs and their definition, measurement, and conjecture; and estimates of industrial waterborne residuals control costs with a review of concepts, methodology and empirical results. Part Three deals with the future and uncertainty as detailed in valuing long-run ecological consequences and irreversibilities. Part Four considers policy issues and institutions as discussed in voting, cost-benefit analysis and water pollution policy; property-right specification and 'distribution' in cost-benefit analysis; individual project analysis vs. comprehensive planning; cost-benefit analyses of cost-benefit analysis; and the role of cost-benefit in policy making. THE CONCEPT OF BENEFITS IN COST-BENEFIT ANALYSIS: WITH EMPHASIS ON WATER POLLUTION CONTROL ACTIVITIES,
Wisconsin Univ., Madison. Dept. of Economics.
R. H. Haveman, and B. A. Weisbrod.
In: Cost Benefit Analysis and Water Pollution Policy, Environmental Protection Agency and Urban Institute Symposium, September 5-7, 1973, Annapolis, Md. Published in 1975, p. 37-66. 1 fig., 31 ref.

Descriptors: *Water pollution control, *Cost-benefit analysis, *Benefits, *Evaluation, Welfare(Economics), Resource allocation, Equity, Direct benefits, Indirect benefits, Intangible benefits, Tangible benefits, Economic efficiency, Compensation.
Identifiers: Option value.

The fundamental meaning of 'benefits' is explored in connection with cost-benefit analysis of public activities, particularly as they apply to water pollution control. First, the conceptual issues of benefits are explored, followed by a discussion and analysis of the 'new welfare economics' which give the concept meaning; then the willingness-to-pay criterion is developed, particularly examining the relationships between benefits and the economic concepts of efficiency and equity. Secondly, the discussion focuses on efficiency and a determination of which types of benefits are or are not properly included in a correctly defined concept of efficiency benefits. Also discussed are the distinctions between primary and secondary benefits, real and pecuniary benefits, external and internal benefits, and tangible and intangible benefits. Then the issues of option price and option value, and donor benefits and equity effects are explored. The fundamental point stressed is the distinction between the 'real social' effects (benefits or costs of a project--those effects that expand the production and consumption potential for the entire society--and the 'pecuniary private' effects--those that do not expand the total potential, but rather, expand it for some persons and contract it for others. A SURVEY OF THE TECHNIQUES FOR MEASURING THE BENEFITS OF WATER QUALITY IMPROVEMENT,
Bowdoin Coll. Brunswick, Maine. Dept. of Economics.
A. M. Freeman.
In: Cost Benefit Analysis and Water Pollution Policy, Environmental Protection Agency and Urban Institute Symposium, September 5-7, 1973, Annapolis, Md. Published in 1975, p. 67-104. 7 fig., 37 ref.

Descriptors: *Cost-benefit analysis, *Water pollution control, *Benefits, *Measurement, *Estimating, Analytical techniques, Welfare(Economics), Econometrics.

The techniques for obtaining monetary measures of the benefits of water pollution control are described and evaluated. The three essential conditions which any technique of benefit estimation must meet if it is to fulfill the needs of water resource planners are: (1) The technique must lead to monetary measures of values or benefits; (2) it must be firmly based on economic theory and concepts of willingness-to-pay and of consumer and producer surplus; and, (3) that some measure of water quality explicitly enters the analysis as a variable. A classification of benefits and the techniques for estimating the kinds of benefits in each classification, is provided in terms of the ways in which changes in water quality enter into the economic processes to become or produce economic goods with values attached to them. The focus is on the necessity for establishing the relationship between changes in abatement levels, changes in quality parameters, and changes in the uses of water as a precondition to estimating the value of improved water quality. The impoundables are how to specifically relate abatement measures to quality changes and uses, the indices of water quality relevat to recreational uses, or how people will respond to changes in different quality parameters, and the links between the quality parameters and discharge rates. COSTS OF WATER QUALITY IMPROVEMENT, TRANSFER FUNCTIONS, AND PUBLIC POLICY,
Resources for the Future, Washington, D.C.
A. V. Kneese.
In: Cost Benefit Analysis and Water Pollution Policy, Environmental Protection Agency and Urban Institute Symposium, September 5-7, 1973, Annapolis, Md. Published in 1975, p. 175-205. 7 fig, tab., 19 ref.

Descriptors: *Cost-benefit analysis, *Water pollution control, *Water policy, *Costs, *Water quality standards, Estimating, Methodology, Industrial wastes, Environmental effects, Mathematical models, Regional analysis.
Identifiers: *Social costs, Opportunity costs, Effluent standards, Ambient standards, Streeter-Phelps equations, Transfer functions.

The discussion centers on the wide variations in the possible costs of controlling water quality. Costs depend upon the levels of water quality contemplated, the strategies envisaged for implementing management programs, the range of technologies admitted, and the restrictions set upon impacts on other environmental media. Detailed regional case studies have been particularly illuminating with respect to the cost-effectiveness of various implementation strategies. These studies have shown the inefficiency of uniform discharge reduction approaches, the potential of effluent charges for approximating least-cost distributions of discharge reduction at individual outfalls, the applicability and efficiency of a wide range of technologies in a regional river-basin context, and the importance of considering direct interdependencies between the various environmental media. These analyses were made possible by combining cost estimates, economic models, and transfer functions into coherent analytical devices. The national water quality control policy is found deficient, as contrasted with the major West European countries, little attention has been given to cost-effectiveness. Economic models are presented illustrating transfer functions for cost analysis, cost minimization and the location of discharges, and a multiple residuals regional management model. It is suggested that pollution control can be more e

tive when administered at a regional rather than national level. (See also W76-11153) (Auen-sconsin)

vironmental Protection Agency-sponsored ial pollution control studies are criticized they cannot be used as ex ante policy n determining trade-offs between costs and of appropriate levels of residuals ges. Some of the major shortcomings of udies are: The estimation of gross costs or tures rather than net residuals manage- sts are of little value in policy making and e the net resources that are foregone. End- treatment has been considered the most ef- and/or the only means of controlling s without consideration of the product out- input variables, and of their influence sts. In-plant process changes that affect and byproduct production--which, in turn, affect the effluents--have been given only cursory attention. The importance of single plant firm vs. the multiple plant firm has not been treated. The EPA studies have not dealt with the administrative and bureaucratic costs of implementing various types and levels of control, and which must be incorporated into the estimate of net residuals management costs. A proper methodology for dealing with these trade-offs in formulating residual discharge strategies is embodied in the studies conducted at Resources for the Future, which analyze the relevant factors that influence net residuals management costs and avoid the shortcomings usually implicit in considering industrial waste treatment costs. Environmental Protection Agency, Washington, D.C.
F. H. Abel.
In: Cost Benefit Analysis and Water Pollution Policy, Environmental Protection Agency and Urban Institute Symposium, September 5-7, 1973, Annapolis, Md. Published in 1975, p. 333-339. 4 ref.

Descriptors: *Cost-benefit analysis, *Pollution abatement, *Regional analysis, *Comprehensive planning, Methodology.

The planning and implementation problems involved in choosing the scope of pollution abatement cost-benefit analysis, both with respect to the geographic area to be included in the analysis and the number of pollutants to be considered are discussed. It is recommended that an area in which significant social, economic, and political interdependencies form a relatively self-contained unit, and that the environmental plan for the unit should include all major pollutant categories: air, water, solid waste, and hazardous materials. The cost-benefit analysis should be based on a single pollutant, media, or multimedia and multipollutant basis depending on synergism among pollutants and the degree to which the control technology can be refined. The level of detail for comprehensive analysis and the ability to aggregate for regional analysis, at a minimum, should include the flow of residuals into the area, generation and assimilation of residuals within the area, and the flow of residuals from the area, and should also quantify the effects of these residuals and the costs of control functions for all sources. When analyzing multiple-objectives, a single cost-benefit ratio may not be the most meaningful or useful result because any proposed program may affect the objectives in different ways. However, a single ratio can be obtained if the costs and the benefits of the different objectives are weighed. (See also W76-11153) (Auen-Wisconsin)

VOTING, COST-BENEFIT ANALYSIS, AND WATER POLLUTION POLICY,
Resources for the Future, Washington, D. C.
P. R. Portney.
In: Cost Benefit Analysis and Water Pollution Policy, Environmental Protection Agency and Urban Institute Symposium, September 5-7, 1973, Annapolis, Md. Published in 1975, p. 293-311. 5 fig., 31 ref.

Descriptors: *Cost-benefit analysis, *Water pollution control, *Political aspects, *Social participation, *Decision making, Resource allocation, Cost sharing, Income distribution, Public benefits, Benefit sharing.
Identifiers: Voting franchise.

The role of political mechanisms in the allocation of resources to water quality program is discussed, with special attention directed to the uses of referendum voting by individuals and the uses of legislative voting (and votetrading) by elected representatives. The nature of water quality programs and the reasons why the market cannot provide a satisfactory allocation of resources, and the way in which individual voting might help choose the optimal level of output of an essentially indivisible 'social good', like water quality, are examined. Also examined is how legislative voting may be expected to alter patterns of resource allocation, especially in the area of water quality. The conclusions are that it is unreasonable to believe that individual voting can lead to the optimal level of water quality unless symmetrical distribution of preferences is produced and the costs of social goods are equally allocated by income redistribution through explicit taxes and transfers. The increased use of referenda is an indication of dissatisfaction with the results of cost-benefit analysis, either due to inaccuracies or to perverse distributional effects. The proper sphere of water quality management is in federal, state, or local legislative bodies in conjunction with other issues of concern, as those responsible for water quality decision should also be those that are equally responsible for decisions on other social goods. LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: Environmental indices.

The rationale for selecting specific environmental quality indices is presented along with an example of the establishment of a regional water quality index. Guidelines for the adoption of indices include: their ability to be understood by the public, their ability to relate to standards or legislative goals as well as to health and lifestyle; their flexibility for updating, and their usefulness for assisting in program management and resource allocation. An example of the application of these guidelines is presented in the form of a water quality index which is based on the percentage of the river or river miles meeting water quality standards. The index involves the utilization of 10 pollution categories: dissolved oxygen, temperature, pH, aesthetics, total dissolved gases, total dissolved solids, radioactivity, pathogens, organic toxicants, and inorganic toxicants. The criterion used for determining whether a violation exists is the state-established health standard for that particular river at a given location. (See also W76-10637) (Kreager-FIRL)

PRELIMINARY INVESTIGATIONS OF A HEADWATER CREEK IN EASTERN KENTUCKY,
Virginia Commonwealth Univ., Richmond. Dept. of Biology.
G. L. Samsel, Jr., J. R. Reed, and R. R. Daub.
Trans Ky Acad Sci. 34(1/2); p 13-21, 1973.

Descriptors: *Kentucky, *Streams, Algae, Fish, *Baseline data collections, *Erosion, Sedimentation, Primary productivity, *Pre-impoundment, Recreation, Water quality, Nutrients.
Identifiers: *Rich Creek(Kent).

Investigations of a headwater stream, Rich Creek, in south-central Lawrence County, Kentucky, were initiated to ascertain the feasibility of impounding this water for construction of an environmentally controlled recreational reservoir. In addition, baseline data were gathered to facilitate studies on effects of sedimentation and erosion. Data collected on physical and chemical parameters, algae, fish, and bottom fauna, as well as primary productivity, indicated that Rich Creek was an undisturbed, headwater stream. Floral and fauna composition and relative abundance indicated good water quality. Nutrient values and primary productivity were low, and in general all parameters analyzed were indicative of a moderate flow, clean, headwater stream which would provide good quality water for a recreational impoundment.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: *Neches River(Tex), Beaumont-Port Arthur-Orange(Tex), Sabine Lake(Tex).

The estuarine segment of the Neches River in South East Texas flows through the middle of a metropolitan area. It is under-utilized for direct contact, water-based recreation. A public opinion poll of the general populus revealed that 66% participated in swimming and/or skiing in lakes and streams in the region, however only 45% of those had so used the Neches in the recent past. Of those who had used the Neches, 50% said they would not do so again. Reason for these attitudes are explored and compared to measured water quality parameters. Another survey of people actually using the river was made. Their responses and attitudes were compared to measured water quality parameter. Effects of historical, well-founded prejudices and media reports of recent violations on attitudes are discussed.

THE IMPACT OF VACATION HOMES ON NATIONAL FOREST WATER RESOURCES,
Arizona State Univ., Tempe. Coll. of Engineering Sciences.
B. A. Segall.
Eisenhower Consortium Bulletin, No. 3, 19 p, April, 1976. 4 fig, 12 ref, 9 tab.

Descriptors: *Recreation wastes, *Forests, Water resources, *Sewage effluents, *Water quality, Water pollution sources, Wastes, *Arizona, Waste water disposal, Waste water treatment, Water pollution control, Sewerage, Soil disposal fields, Environmental effects, *National Forests.

Wastewater disposal studies in northern Arizona were undertaken to determine the impact of second homes and related vacation development on streams in semiarid regions. The investigation showed that sewage flow rates are dependent upon home occupancy and fluctuate widely in comparison with suburban and urban areas. This sporadic waste discharge is deleterious to package type treatment plant systems. Dispersed well-designed and maintained soil disposal systems are preferred in a forest environment. Conventional sewerage systems and treatment plants concentrate wastewater flows, partially treat waste materials, and are less desirable. (Witt-IPC)

AGRICULTURE AND CLEAN WATE... PROCEEDINGS OF A CONFERENCE TO ... PLORE CONTROL STRATEGY FOR AGRIC... TURAL NONPOINT SOURCE WATER POL... TION.
Report EPA 600/9-75-005, August 1975. ... ference held in Kansas City, Missouri, Apr... 1975, 153 p. Sponsored by Midwest Researc... stitute and Environmental Protection Agency.

Descriptors: *Water pollution control, *W... quality, *Legal aspects, Farm wastes, Sedim... control, Soil conservation, Erosion, Plans... Agricultural runoff.
Identifiers: *Nonpoint source pollution, F... nutrients, Control planning.

The conference was held to promote a const... tive dialogue on the development of plans fo...

rol of agriculture related nonpoint source pol-
n arising from sediment erosion, fertilizer ru-
livestock wastes and pesticide residues. The
ing session was devoted to an analysis of the
of the art on nonpoint source pollution re-
to agriculture with presentations on: (1) re-
l aspects and viewpoints; (2) agricultural pol-
n control; (3) technical basis of control; (4)
rvation districts; (5) soil conservation; and
ant nutrients. The luncheon session was con-
d with an economic overview, consisting of
dress on economic problems and opportuni-
f pollution control. The afternoon session
esigned to explore elements of control strate-
anning for nonpoint pollution from agricul-
sources with papers on: (1) the states' role;
e state's approach; and (3) the role of the
r and agribusiness. The afternoon session
concluded with a panel discussion on the
opment of a practicable agricultural pollution
ol plan. Over 175 individuals from 20 states
senting local, state, regional, and federal
ltural and environmental agencies attended
nference. Also, included in the 75 different
izations represented at the conference were
ees from farmer associations, educational
tions, and agribusiness. (See also W76-11407

**ES ROLE IN FORMULATING CONTROL
TEGY,**
s State Board of Health, Topeka. Div. of
nmental Health.
Metzler.
eport EPA 600/9-75-005, August 1975.
lture and Clean Water--Proceedings of a
rence to Explore Control Strategy for
ltural Nonpoint Source Water Pollution,
s City, Missouri, April 3, 1975, p. 83-92.

ptors: *Sediments, *Water pollution con-
griculture, Nitrogen, *Kansas, *Coliforms,
wastes, Water quality standards.
iers: Fecal coliforms.

Kansas area, the problem of controlling
tural pollution is caused by too much sedi-
nd too much nitrogen. In order to develop a
y which is rational in controlling the pollu-
e should ask--does it affect human health,
eded because it affects human health, is it
because it improves the quality of fish or
, or is it needed in order to control algal
or the growths of weeds. Every river basin
rent and different control strategies are
d. Most of the time, all the major streams
Kansas are in compliance with the stan-
hich Kansas has adopted and which are a
he standards filed with EPA. The total dis-
olids concentration and the fecal coliform
represent the areas of most frequent viola-
cal coliform violations occur usually as a
rainfall and excessive runoff or snowmelt
accompanying runoff. The fecal coliform
was violated approximatey 25 percent of
directly as a result of nonpoint source ru-
e fecal coliform effluent limitation for
domestic wastewater discharges is 200
iform per 100 ml, and this is an extremely
limit; few wastewater discharges in Kan-
meet it. However, at low stream flow, the
iform standards of 400/100 ml in Class A
nd 2,000/100 ml in Class A waters and
ml in Class B waters are rarely violated.
tion to the control problem requires care-
ning a rational approach, and a major
commitment on the part of the agricul-
ustry, and government. (See also W76-
ameron-East Central)

MNION OXYGENATION,
rbide Corp., New York. (Assignee).
st, W. E. Grunert, and J. J. Pietruszewski.
U.S. Patent No. 3,956,124, 8 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 946, No 2, p 730, May 11, 1976.

Descriptors: *Patents, *Water treatment, *Hypolimnion, *Stratification, *Oxygenation, *Thermal stratification, Lakes, Bottom water, Water pressure, Equipment, Conduits, Impoundments.

A lake or impoundment may be sufficiently deep to stratify thermally during the warm season of the year as the surface layers of water rise in temperature. Due to a relatively high biological oxygen demand, the dissolved oxygen level in the hypolimnion drops to a low level unfavorable to the ecology of the body of water. Whereas the DO deficiency is caused by the high biological oxygen demand, its development and persistence is dependent upon natural thermal stratification which in effect isolates the bottom water from the source of atmospheric oxygen at the surface. It is usually desirable to preserve thermal stratification in lakes and reservoirs. This invention relates to a process for oxygenating the hypolimnion of thermally stratified water bodies with high purity oxygen gas, using side stream pumping, without destroying the thermal stratification. In the process water is withdrawn from the hypolimnion at a rate of 10-200 percent of the hypolimnion volume per month, pressurizing the withdrawn water to superatmospheric pressure below 125 psig, injecting at least 80 percent oxygen gas at a rate of 5-300 lbs. 02 per million pounds withdrawn water but less than a rate to result in 02 supersaturation at the remixing point, returning the mixture through conduit means and remixing it at a rate to produce specified frictional head loss. Descriptors: *Bacteria, Inhibition, Plankton, Algae, Biocontrol, *Algal control, Reviews, Sea water, Marine animals.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: *Telluric bacteria.

The literature on inhibiting extracellular substances produced by marine algae and bacteria is reviewed, with a view to ascertaining their importance in the control of natural populations. Numerous planktonic species are able to produce these substances, but none of the data reported, including those obtained with chemically purified substances, indicate that they play an important role. The significance of antibiosis seems in fact to be over-rated. The antibacterial activity of sea water against telluric bacteria carried to the sea by rainfalls or sewage should be considered as 1st resulting from inimical heavy metals ion activity and from their lack of ability to take up the organic substrates, because of their very low concentration in sea water. Thus, telluric bacteria are unable not only to compete with natural marine bacteria, but also to survive for a long time. The substances released by plankton, especially by algae, are taken up only by marine bacterial strains, which prevent their accumulation so that telluric bacteria usually remain starved. Marine algae and bacteria seem to be rarely inhibited by antagonistic metabolites, because the cell densities are not high enough to release the necessary quantities for an activity level. Grazing and competition for nutrients are the most important factors in controlling algal and bacterial populations.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Farm wastes, *Confinement pens, *Public health, *Human diseases, Fertilizers, Microorganisms, *Bacteria, Water pollution control, Waste disposal, Legal aspects, Disinfection, Odor.
Identifiers: Antibiotics.

Keeping animals in large confinements creates special problems in epidemiology of infectious diseases and environmental protection. Epidemiologicl questions are closely connected with the excrements of animals. Chemical disinfection of physical treatment of animal manure can help to prevent spread of infectious microorganisms by using the excrements as fertilizer. The odor nuisances caused by the manure are linked to the use of too large amounts of slurry on agricultural fields by which damage is done to the soil and the plants. Hygienic problems are also created by feeding antibiotics to animals which may cause infectious resistance in various types of bacteria. The influence of untreated effluents on the receiving surface waters or ground waters must be considered from the point of view of water pollution. The same is true for the hygienic disposal of animal carcasses or parts of them in an adequate system of rendering plants. Governmental authorities are, by legislation, trying to get the nuisances of the environment caused by large animal confinement units under control.--Copyright 1976, Biological Abstracts, Inc.

DATA MANAGEMENT: KEY TO ENVIRONMENTAL QUALITY ASSESSMENT,
National Oceanic and Atmospheric Administration, Washington, D. C. Environmental Data Service.
T. S. Austin.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 25-1-1 - 25-1-4. 1 ref.

Descriptors: *Data collections, *Data processing, *Data transmission, *Information exchange, *Information retrieval, *Monitoring, Programs, Measurement, *Pollutant identification, Remote sensing, Methodology.

An evolving generic concept for an integrated data management system designed for investigating pollution of the marine environment is outlined. The concept incorporates knowledge and experience gained in large-scale, interdisciplinary data collection and interpretation programs such as the Barbados Oceanographic and Meteorological Experiment, the International Field Year for the Great Lakes program, American programs during the International Decade of Ocean Exploration, the Atlantic Tropical Experiment of the Global Atmospheric Research Program, and the development of a National Oceanic and Atmospheric Administration environmental quality monitoring plan for proposed oil and gas activities on the United States Continental Shelf. An international marine pollution monitoring pilot project known as the Integrated Global Ocean Station System is also described. The project involves a cooperative system for the unrestricted international exchange of ocean data, information, and services. Data are collected by 78 participating countries and are transmitted to users through the Global Telecommunication System. The rapidly developing role of remote sensing via satellite is also discussed. (See also W76-10637) (Kreager-FIRL)

A PRACTICAL DATA MANAGEMENT SYSTEM FOR MONITORING AND MANAGING LARGE DISTRIBUTED ECOSYSTEMS,
Michigan State Univ., East Lansing. Dept. of Electrical Engineering and Systems Science.
P. D. Fisher, and J. R. Cruitt.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 25-5-1 - 25-5-6. 2 fig, 2 tab, 5 ref.

Descriptors: *Data collections, *Data processing, *Information retrieval, *Monitoring, *Watershed management, Computers, Water quality control, Methodology, Pollutant identification, *Ecosystems.

A data management system which has many of the operational characteristics of the Environmental Protection Agency's Water Quality Control Information System is described for the monitoring and managing of large distributed ecosystems such as major watersheds. Data for the system are organized according to date, location, and parameter menonic. The system presently contains over 200 defined stations and over 1000 defined parameters. Raw data are being routinely put into the system at a rate of more than 250,000 entries/year. The system includes four possible output format options, including a format suitable for insertion into

the Environmental Protection Agency s Wat
Quality Control Information System. Data are o
ganized and temporarily stored on disc and th
periodically moved to magnetic tape. The da
management system is well suited for a mediu
sized computer facility and for the on line manag
ment of ecosystems in which throughput da
delays of not more than 24 hours are required
data collected in situ and 2 weeks for data whi
must pass through analytical laboratories. (S

THE ROLE OF ENVIRONMENTAL DA BANKS IN ENERGY RESOURCE DEVELO MENT,
Kentucky Univ., Lexington Inst for Mining
Minerals Research
J. E. Jones, and G. E. Smith
In: International Conference on Environme Sensing and Assessment, Vol. 2, September 14- 1975, Las Vegas, Nevada, p 25-6-1 - 25-6-5. 8 13 ref

Descriptors: *Data collections, *Informa retrieval, *Industrial wastes, *Informa exchange, *Pollutant identification, Surf waters, Groundwater, Heat, Heat transfer, E gy conversion, Coals, Kentucky
Identifiers: Coal conversion plants.

The Environmental Data, Information, and Lit ture Bank being developed by the Universit Kentucky for assessing the environmental, so and economic aspects of producing clean from coal is described. The data bank is desi to promote information exchange between related governmental and private projects as energy development community. Environme impacts of interest to the environmental data include those associated with air, water, n and solid waste pollution. Specific data will be lected on surface water and subsurface water tamination and the generation and transfer of to water resources. The data bank is viewed necessary and integral part of the total en development program in Kentucky since each conversion plant will be required to prepare a vironmental impact statement. Hawaii Univ., Honolulu. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-256 429, $11.75 in paper copy, $3.00 in microfiche. June 1975, 489 p. OWRT A-049-HI(1). 14-31-0001-5011.

Descriptors: Water resources, *Information retrieval, *Information exchange, *Hawaii, Conferences, Publications.

The objective of the Hawaii's Water Resources Information Dissemination project is to make more widely available reprints of professional articles, papers presented at scientific meetings, and reports of a limited circulation by WRRC staff and affiliate members. These studies, which are multidisciplinary in scope, identify, evaluate, assess, and measure the interacting factors that affect water resources in Hawaii. The publication of these specialized articles and papers makes available the results of a broad spectrum of research activity which, though specialized, is interrelated and provides an overall picture and understanding of the direction of current research in Hawaii. Descriptors: *Water resources development, *Attitudes, River basins, Surveys, Education, *Canada, Social participation.
Identifiers: Public participation, Community residents, Status variables, *Dunk River basin(Canada), Level of living, Organizational participation.

The objective of this paper is to identify the variables which relate independently to attitudes toward water resources development and to determine whether or not these variables have a greater additive effect on attitudes when combined into an index than when considered singly. Six status vari-

LIBRARY U. OF I. URBANA-CHAMPAIGN

ables, which have been found more or less consistently in previous studies to have relationship with attitudes, are related to attitudes toward Dunk River development. Four variables -- education, occupation, level of living, and organizational participation -- appear to have significant relationships with attitudes in this study. The relationships of length of residence in community and age with attitudes are not significant. The analysis of local attitudes is useful in identifying factors which affect the participation of community residents in water resources development activities, assuming that favorable attitudes are associated with increased participation. Identifiers: *Cost-effectiveness, *Tisza River basin(Hungary), Energy requirements, Sensitivity analysis, System performance.

The definition and comparison of alternative water resource systems designed to meet long-range goals (say 60 years) is illustrated by a case study of the Tisza River Basin in Hungary. A comprehensive cost-effectiveness approach is adapted to define goals, specifications, criteria, and alternatives and their capabilities. Specifications include demands given in probabilistic terms. The comparison of alternative systems is based on 12 criteria, one of which is the balance between total energy consumed and peak energy produced. Important factors involving social elements, such as flood protection and land and forest use, are described both as monetary quantities and as qualitative appreciations. Five alternative systems are defined involving flat land reservoirs, pumped storage reservoirs, interbasin transfer, and conjunctive use of surface and ground water. International cooperation is then used to rank systems and reduce the problem to a tradeoff between only two alternatives. (Bell-Cornell)

SOME INSTITUTIONAL AND CONCEPTUAL THOUGHTS ON THE MEASUREMENT OF INDIRECT AND INTANGIBLE BENEFITS AND COSTS,
Wisconsin Univ., Madison. Dept. of Economics
J. Bishop, and C. Cicchetti.
In: Cost Benefit Analysis and Water Pollution Policy, Environmental Protection Agency and Urban Institute Symposium, September 5-7, 1973, Annapolis, Md. Published in 1975, p. 105-126. 15 ref

Descriptors: *Water pollution control, *Cost benefit analysis, *Project benefits, *Measurement, *Intangible benefits, *Intangible costs, Econometrics, Aesthetics, Evaluation, Social values, Mortality, Psychological aspects, Morbidity.
Identifiers: Option value, Hedonic pricing.

The concepts as to how to include intangible and environmental non-user benefits (such as the valuation of postponing death, indirect benefits of postponing death, the valuation of good health), and the application of the hedonic method to measurement of the private valuation of risk are propounded. It is suggested that the characteristic approach to utility theory be used to give a systematic theoretical basis to methods for using observable market prices to place values on nonmarketed outputs. By viewing the consumer's utility function as defined over a limited number of attributes or consumption activities rather than over an infinite list of unique products, commonalities can be defined between things that are sold in markets and the free or public goods that are not. The trade-offs between money and a characteristic that people exhibit in their private behavior can be used to estimate the implicit price of attributes provided by public projects. The attributes that often appear as intangibles in cost-benefit analysis--risk of early death, pain, loss of personal beauty, option value, congestion, disruption in the use of nonwork time--are discussed and methods for evaluating them monetarily are suggested and evaluated. As intangible benefits are not distributed over project design or program clientele proportionately to the more easily measured benefits, their elimination inevitably distorts the planning process. W76-11156

A SURVEY OF EMPIRICAL BENEFIT STUDIES,
Environmental Protection Agency, Washington, D.C.
D. Tihansky.
In: Environmental Protection Agency and Urban Institute Symposium, September 5-7, 1973, Annapolis, Md. Published in 1975, p. 127-172. 1 fig., 3 tab., 113 ref.

Descriptors: *Intangible benefits, *Cost-benefit analysis, *Water pollution control, *Methodology, *Estimating, Econometrics, Evaluation, Pricing, Reviews, Water quality standards, Water utilization.

Selected studies contributing most to the conceptual framework and empirical insights of benefit evaluation are reviewed, with less than 30% found theoretically valid; even fewer seem cognizant of the applicability, let alone the existence of welfare economics. The state of the art on benefit studies is outlined and the empirical findings contrasted. The criteria for judging the adequacy or relevance of benefit assessment are prescribed, the literature evaluated according to these criteria, and the utility of translating all benefits into precise monetary values analyzed. An Appendix examines selected references for methodological weaknesses and reviews empirical estimates with emphasis on their adaptability to local and regional planning. Extensive comments on the references are contained in the Appendix, where the studies are partioned according to their focus on a specific pollutant, a particular water use, or a more comprehensive analysis. The Appendix concentrates on the [illegible] application or misinterpretation of theoretical empirical notions, i.e., having chosen methodology for benefit estimation, the empir next faces problems of gathering relevant d formulating reliable damage relations from data, and then interpreting them in a pr economic perspective. A multidisciplin framework of analysis, as implemented succ fully in regional planning, is recommended a most viable alternative to benefit analysis (See also W76-11153) (Auen-Wisconsin)

COST-BENEFIT ANALYSIS, PROPE RIGHT SPECIFICATION 'DISTRIBUTION',
Rand Corp., Santa Monica, Calif.
J. A. Stockfisch.
In: Cost Benefit Analysis and Water Pollutio icy, Environmental Protection Agency and Institute Symposium, September 5-7, 1973 napolis, Md. Published in 1975, p. 313-331. 12

Descriptors: *Cost-benefit analysis, *Resou location, *Legal aspects, *Pollution abate Decision making, Theoretical analysis, Pr aspects, Law enforcement, Social value, M tion, Welfare(Economics).
Identifiers: *Property rights, Common pro Externalities, Incentive.

The concept of 'property rights'--that 'i scheme of relationships between individual respect to an object' and the idea of 'excl precede the discussion of the property rig proach in cost-benefit analysis. The struct property rights both constrains and motivate ple with respect to the use of scarce comm and services; thus it impacts on the utilitie vided by various outputs and hence on relat mands and resource allocation. Changes in l the content of property rights cannot help fect the distribution of resource earnings, and welfare, hence both relative prices an observed in the economy are functions of th and political systems. Environmental qual provements can generally be implemented public realm by either constraining pr behavior by law; or by undertaking resource-using projects or activities. Cha the law and outputs of government project income distribution and the relative pri resources and other inputs--and through thi can change government program costs--the on costs will be in the future. This as general interdependence, however, would used to reject existing prices as appropria sures of program or project costs. (See als 11153) (Auen-Wisconsin)

THE REDISTRIBUTIONAL CONSEQUENCES OF PUBLIC RECREATION PROVISION AT THE POTHOLES RESERVOIR--COLUMBIA BASIN PROJECT, WASHINGTON,
Washington State Univ., Pullman. Dept. of Agricultural Economics.
K. C. Scott, and C. D. Ditwiler.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 577, $5.50 in paper copy, $3.00 in microfiche. Washington Water Research Center, Pullman, Report No. 25, May 1976. 101 p, 3 fig, 41 tab. 58 ref, 3 append. OWRT A-066-WASH (2). 14-31-0001-5048.

Descriptors: *Recreation, *Washington, Reservoirs, *Benefits, *Estimated costs, Human population, Cost analysis, *Recreation demand, Distribution patterns, Social aspects, Economics.
Identifiers: Public costs, *Potholes Reservoir(Wash), *Columbia Basin Project(Wash).

The purpose was to identify the redistributional consequences of the public recreation provision at the Potholes Reservoir. The Potholes Reservoir serves as a small storage reservoir within the Bureau of Reclamation's Columbia Basin Project. Although the reservoir was originally constructed for irrigation purposes, it receives extensive recreational use by recreationists from all parts of the state of Washington. State and local governments have provided a majority of the funds for the recreational facilities at the reservoir as well as usual operation and maintenance costs. Benefits were assigned to relevant socio-economic classifications of recreationists based on the results of a recreation survey wherein 2,650 recreational parties were interviewed. Estimates of the public costs of providing and maintaining outdoor recreation opportunity at the reservoir were obtained from federal and state agencies administering public recreation in the area. The final incidence of these public costs were assigned to income classes, and subsequently to geographical areas and age groups according to the estimated tax incidence effect of the public sector in the state. The recreationists receiving positive redistributional impacts were the lower classes ($0-7,500 annual income), the young (under 25 years of age), the elderly (over 55 years of age), and the recreationists residing in the geographical areas adjacent to the reservoir area.

Identifiers: *Multiple Objective Planning.

The workshop originated as an effort on the part of the Committee for Education and Research in the Social Sciences of the Universities Council on Water Resources. During the 1972 UCOWR annual meeting a task force was established to identify research topics and problems related to multiple objective planning and decision making; during the 1973 UCOWR meeting it was decided to have the workshop. The workshop itself was designed to provide a means of exchange between federal agency planners and university researchers. Agency planners -- through position papers -- provided basic input to use in multiple objective planning. (See also W76-11174)

The conference discussed was a result of efforts by the Committee for Education Research in the Social Sciences of the Universities Council on Water Resources. During the 1972 UCOWR annual meeting, a task group was established to identify research topics and problems related to multiple objective planning and decision making. At the 1973 UCOWR annual meeting, a resolution was passed calling for a national Workshop-Conference on the topic. The Conference was designed to allow the university people to present their ideas for public discussion by federal agency planners. The Workshop papers were presented in Volume 1, the present volume contains the Conference papers, together with summaries of the discussion and panels. (See also W76-11173)

SYSTEMATIC DEVELOPMENT OF METHODOLOGIES IN PLANNING URBAN WATER RESOURCES FOR MEDIUM SIZE COMMUNITIES. PHASE I. FINAL REPORT,
Purdue University, West Lafayette, Indiana, Water Resources Research Center.
J. W. Delleur, J. M. Bell, L. Z. Breen, W. N. Melhorn, and W. L. Miller.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-256 565, $5.00 in paper copy, $3.00 in microfiche. Technical Report No. 74, April 1976, 71 p, 17 fig, 18 tab. OWRT C-3277(No 3713) (12).

Descriptors: *City planning, *Urban drainage, *Social aspects, *Economics, *Land use, *Urban hydrology, *Ground water, Drainage systems, Urban runoff, Urbanization, Storm drains, Groundwater movement, Water pollution, Population, Distribution patterns, *Indiana, Oklahoma, Illinois.
Identifiers: *Demographic studies.

The interdisciplinary study for planning urban water resources development gives models for estimating population growth, water demand, quantity and quality of surface runoff, and availability of ground water for communities in the 100,000 to 200,000 population range. These models were extended for a 25 to 30 year period. The test area was principally the Lafayette and West Lafayette, Indiana area. Additional sites in Indi-

LIBRARY U. OF I. URBANA-CHAMPAIGN

ana, Oklahoma, and Illinois were used for specific purposes. Life tables were developed for the area and a regression equation proposed which relates water consumption to size and value of houses, rental values and population age distribution. A procedure for developing aquifer maps is presented as well as a ground water model which responded to different pumping stresses. Deterministic and stochastic models of the lumped non-linear type are presented which portray the rainfall-runoff process and appropriately quantify the effects of urbanization on runoff. For the water quality model, suspended solids and BOD are utilized, and if possible to obtain, total and fecal coliform counts, total solids, COD, and phosphorus data. Alternative methods of surface drainage were considered and comparisons made of the benefit-cost relationship of providing the various drainage systems before urbanization has begun and after it is completed. Identifiers: *Lafayette(Ind).

A deterministic digital model is developed representing glacial aquifers to assist water resource planners of medium size urban communities. The glacial aquifer selected as the test site was that underlying the Greater Lafayette, Indiana Area. The digital model was formulated by using the finite difference method. Initial estimates of recharge from ponds and base flow into streams were obtained from a flow net analysis. Cross correlations and time lags between rainfall, river stages and groundwater levels were examined to introduce net recharge due to rainfall into the model and to establish the hydraulic interaction between the rivers and the aquifer. The digital model was calibrated by using a parameter adjustment procedure. The values of hydraulic conductivity, storage coefficient, net recharge due to rainfall and base flow into the stream were suitably adjusted to simulate the observed historic water levels. Stochastic difference equation models were fitted into the historic input time series of rainfall and river stages and these models were used to provide inputs to estimate the aquifer capacity under increased water demand. Results showed that the cross correlation studies were useful in introducing recharge due to rainfall and in examining the hydraulic connection between the rivers and the aquifer. The vertical leakage from the overlying aquitards and the induced streambed infiltration were included in the digital model as lumped quantities without considering the physical properties of the overlying aquitards and the streambed. SYSTEMATIC DEVELOPMENT OF METHODOLOGIES IN PLANNING URBAN WATER RESOURCES FOR MEDIUM SIZE COMMUNITIES: POPULATION CHARACTERISTICS AND RESIDENTIAL WATER USE,
Purdue Univ., Lafayette, Ind. Dept. of Sociology and Anthropology.
H. R. Potter, E. R. Cooper, and L. Z. Breen.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 566, $4.00 in paper copy, $3.00 in microfiche. Purdue University Water Resources Research Center, Technical Report No. 63, May 1976. 35 p, 5 fig, 15 tab, 88 ref. OWRT C-3277(No. 7313) (13).

Descriptors: *Community development, *Growth rates, Human population, Social aspects, Urban sociology, City planning, Water utilization, *City planning, *Indiana, Regression analysis.
Identifiers: *Demographic studies, Urban Water Resources Development, Medium size communities, *Lafayette(Ind).

Household technology has increased the use of residential water. In this study involving the Lafayette-West Lafayette, Indiana Area, there were substantial differences in the quantity of water used by different residences and these differences were shown to be related to socio-economic and demographic characteristics. These relationships, in combination with population projections, can be used for predicting future water demand. The use of tracts and blocks were compared in the study. Tracts were the larger area units containing 4000 or more persons. Because of the larger number of blocks, there was an advantage in their use in examining relationships. In the analyses high income tracts had per capita water consumption rates about 3 times that of the low income. Positive relationships were found between water use and housing value, median number of rooms, percent of families in single dwellings, percent of high school graduates and percent of white collar workers. Percent in families below the poverty level was negatively related. Multiple regression analysis of the block data generally supported the interpretation of the tract data. Age of residents did not show a consistent pattern. Significant interactions were found for age with owned housing values and home size. (See also W76-11175) (Wierswa-Purdue)

MANAGEMENT OF WATER RESOURCES UNDER DIFFERENT SOCIO-ECONOMIC CONDITIONS,
Arizona University, Tucson, Committee on Arid Lands Resources.
S. M. H. Bokhari.
Ph.D. Dissertation, 1975. 289 p, 24 tab, 130 ref.

Descriptors: *Arid lands, *Water resources development, *Water management(Applied), *Constraints, Cost-benefit analysis, Decision making, Social aspects, Economics, Management, Project planning, Project post-evaluation, Irrigation, *Arizona, *Crop production.
Identifiers: Wellton-Mohawk Irrigation District(Ariz), Salinity Control and Reclamation Project(Pakistan), *Pakistan.

A review is presented of current strategies, objectives, methodologies and practices in the field of water resources development and management, with particular attention to constraints under different socio-economic conditions. The applicability of a 'cost-effectiveness' approach to hindsight evaluation of water projects is discussed. That approach can be used for 'ex-ante' and 'ex-post' evaluation, comparative evaluation of more than one objective, and for tangible and intangible measures of effectiveness. Water management under different socio-economic conditions has been analyzed by comparing the performances of the Wellton-Mohawk Irrigation District in Arizona with the Salinity Control and Reclamation Project No. 1 in Pakistan. The American system is flexible enough to accomodate any technological innovation and can supply the full water requirement for any cropping pattern, while the Pakistan system has an inelastic 7-day fixed roster for water supply which is inadequate for even 50% of the presently irrigated area. Recommendations are made for removing management constraints in Pakistan and other developing countries. (Jahns-Arizona)

Identifiers: Benefit maximization, Nonautonomous models, Nonlinear programming, Capital theory.

While the link between fisheries economics and capital theory has long been recognized, fisheries economics has, until the last few years, developed largely along nondynamic lines. The purpose of this article is to demonstrate that, with the aid of optimal control theory, fisheries economics can without difficulty be cast in a capital-theoretic framework yielding results that are both general and readily comprehensible. Developed is a dynamic linear autonomous model. The static version of the fisheries economics model is seen to be the equivalent of a special case of the dynamic autonomous model. The model is then extended, first by making it nonautonomous and second, nonlinear. Problems arising therefrom, such as multiple equilibria, are considered. (Bell-Cornell)

Identifiers: *Cost minimization.

A rural water system is a water supply and distribution system that is built for low density predominately unincorporated rural areas. It primarily serves domestic and livestock needs and does not necessarily supply fire fighting requirements. The pipe distribution network has the unique feature of being an unlooped or dead-end system in most cases. This paper describes a method for achieving the least cost or 'optimal design' for certain portions of rural water distribution system. Optimization is achieved by methods that combine linear programming and engineering judgment. The variables that can be considered by this programming approach are: (1) pipe diameter; (2) pipe pressure rating; (3) pressure reducing valve setting and location; and (4) pumping head or water tower height. The method has been demonstrated on a simple hypothetical distribution system with good results. (Bell-Cornell)

THE IMPACT OF FLOODING UPON LAND VALUES IN THE BIG BLACK RIVER BASIN,
Mississippi Univ., University. Dept. of Economics.
W. E. Boyet, K. W. Hollman, and L. Sterling.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 578, $4.00 in paper copy, $3.00 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Completion Report, July 1976. 38 p, 3 fig, 7 tab, 21 ref. OWRT A-093-MISS(1).

Descriptors: Floods, *Flood damage, *Property values, Prices, *Pricing, Land appraisals, *Mississippi, Land use, Regression analysis, Model studies, Costs, Economics.
Identifiers: *Big Bear River basin(Miss).

The purpose was to determine the impact of flooding upon the value of land in the Big Black River basin. Economic rent theory was extended and modified to explain how flooding influences land values. Two theoretical components of the overall effect of flooding were identified. First, it tends to cause shifts in land use to end eavors which yield lower returns. Second, it tends to increase production costs. The combined effect is to reduce realized earnings, thereby reducing land values. In order to obtain empirical estimates of these effects, sales price and other characteristics were ascertained for two independent samples of transfers, one which was flood-prone and one which was flood-free. Regression analysis was used to develop a model to explain variation in transfer prices for each of the two samples. Different variables were important in explaining price variation and there were significant differences in the coefficients of some variables between the two regressions. Additional regression analysis conducted on the flood-prone sample suggested that flooding which causes crop damage results in a reduction in value of $28 per acre or approximately 13 percent.

EGISLATION ON UNDERGROUND

Agricultural Organization of the United ome (Italy).

In: Water Law in Selected European Countries, 1975. Vol 1, Chap IX, p 136-138, 24 ref.

Descriptors: *Water law, *Foreign countries, *Water rights, Administrative agencies, Riparian rights, Groundwater, Water wells, Drilling, *Legislation, Europe, Water pollution control, Legal aspects, Thermal water, Mineral water.
Identifiers: *Italy, Drilling permits, Water resource protection districts.

Exploitation of ground water is subject to different legal authorities depending on whether the activities take place within or outside of water resources protection districts. Within water resource protection districts ground water exploration is subject to administrative authorization with the local Office of Civil Engineering. Identified ground water bodies are registered as public water by the Ministry of Public Works. Rights to exploit registered public ground water are subject to administrative conformation. The right to exploit non-public ground water is free for the Riparian landowner provided he observes legal distances and conditions of exploitation. Outside water resource protection districts ground water exploration is free. The right to use non-public ground waters outside water resources protection districts is equally free subject to the same limitations as apply to riparian landowners within such districts. The provinces of Trento and Bolzano are delegated as sovereign legislative powers in respect to mineral and thermal waters. Conditions of mineral and thermal water exploration within authorized areas are identical to those governing ground-water exploration. (Heiss-NWWA)
W76-11124

SPAIN, (LEGISLATION ON UNDERGROUND WATERS).
Food and Agricultural Organization of the United Nations, Rome (Italy).
In: Water Law in Selected European Countries, 1975. Vol 1, Chap IX, p 188-192, 12 ref.

Descriptors: *Water law, *Foreign countries, *Water rights, Administrative agencies, Groundwater, Water wells, Drilling, *Legislation, Legal aspects, Water pollution control, Europe, Thermal water, Mineral water.
Identifiers: *Spain, Drilling permits, Andalusia, The Baleares, Almeria, Mineral waters, Thermal waters.

Ground water may be designated as either public or private. Public underground waters are those extracted or flowing on public domain lands and those occurring under the bed and within one hundred meters on either side of public streams. Private underground waters are those being extracted or flowing on private land. Ground water exploration on public land requires an administrative license. Exploitation necessitates an administrative concession. Ground water extraction works may be implemented only outside a 40 meter distance from neighboring buildings, railways or roads and outside a 100 meter radius of another well, spring, water course or public animal watering place. The extraction of private underground waters is subject to an administrative authorization rather than to a concession. In contrast, water legislation applicable to the Canary Islands dictates that all extractions and diversions, whatever the type of water, always require the authorization of the Hydraulic Services of the Canary Islands and Santa Cruz de Tenerife. Following the same approach the private underground water legislation for Andalusia, the Baleares and Almeria prohibits all extraction and diversion works except for ordinary wells until regulatory laws have been established. Mineral waters are classified as (a) Mineral-Medicinal Waters, which, because of their characteristics and quality are declared of public interest; (b) Mineral-Industrial Waters which allow for the rational use of substances they contain; (c) Thermal Waters, the temperature of which exceeds by 40 degrees centigrade the mean temperature of the place of emergence. Mineral waters are controlled by the Ministry of Industry, the General Directorate of Health and the Ministries of Public Works and of Agriculture. (Heiss-NWWA)
W76-11125

TURKEY, (LEGISLATION ON UNDERGROUND WATERS).
Food and Agricultural Organization of the United States, Rome (Italy).
In: Water Law in Selected European Countries, 1975. Vol 1, Chap IX, p 236-237, 11 ref.

Descriptors: *Water law, *Foreign countries, *Water wells, Administrative agencies, Groundwater, Drilling, *Legislation, Legal aspects, Water pollution control.
Identifiers: *Turkey, *Drilling permits.

The water laws of Turkey dictate that all ground water exploration operations are to be undertaken in accordance with the specifications issued by the Ministry of Power and Natural Resources. The drilling of all wells requires a permit issued by the General Directorate of Hydraulic Works (GDHW). Once ground water has been found, its use is authorized immediately but is limited by the beneficial use criterion. In addition an application for the obtention of an exploitation permit is to be filed with the GDHW. The permit will state the authorized amount of water to be extracted and used. Public exploration or control wells may be sunk on private land without the requirements of expropriation and compensation, the transformation thereof into exploitation wells is subject to the expropriation of private land for the well itself and for related water conveyance installations. Control of aquifer depletion is administered by the Ministry of Power and Natural Resources. Although the drilling of wells for purposes other than Water Resource exploitation does not require a water use permit, the GDHW does request information from such well operators so as to preclude interference and contamination of adjacent ground water supplies. Identifiers: *Imperial Valley(Calif).

LIBRARY U. OF I. URBANA-CHAMPAIGN

In order to delineate social and political issues relating to geothermal development, certain local government officials and community leaders in the Imperial Valley were interviewed on their perceptions of the potential of geothermal resources and regulatory problems implicit in development. County officials exhibited a strong belief that they had an 'overall responsibility' for the general welfare of the residents of Imperial County who would be affected by the potential economic, social, and environmental impacts of geothermal development. With little coordination among agencies at higher levels of government, County officials looked upon County regulations and coordination as a positive force that could: (1) minimize the negative impacts of geothermal development (2) encourage multipurpose utilization of geothermal resources, and (3) improve land use planning within their jurisdiction. Recommendations for improving the regulatory process include organizational and procedural changes and amendments to state energy legislation. Suggestions for improving public input into the governmental decision making process were presented in order to make geothermal regulations a joint effort of commercial developers, public officials, and private citizens. DEVELOPMENT OF REGIONAL WATER MANAGEMENT SYSTEMS OPERATIONAL PROCEDURES,
University of Southern Mississippi, Hattierburg, Bureau of Business Research.
D. J. Etzold, and D. C. Williams, Jr.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 571, $4.00 in paper copy, $3.00 microfiche. Mississippi Water Resources Research Institute, Mississippi State, Completion Report, July 1976. 37 p, 1 tab, 9 ref, append. OWRT A-094-MISS (1).

Descriptors: Regional development, Management, *Water supply development, *Mississippi, *Regional analysis, *Institutional constraints, State governments, Local government.

The purpose was to identify multigovernmental constraints inherent in regional water supply development and to generate an organizational and procedural framework. There is some discussion of current water supply problems in southeast Mississippi, in general, and Jackson County, in particular. Governmental agencies with water development and management jurisdiction in Jackson County are identified. Thirteen officials and professionals were interviewed for the purpose of deriving their views on development of a regional water supply system. The results of the interviews are summarized. An organizational and procedural framework is discussed.

EVALUATION OF PRIOR APPROPRIATION IN MISSISSIPPI,
Mississippi State Univ., Mississippi State. Water Resource Research Inst.
L. O. Putt.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 581, $4.50 in paper copy $3.00 in microfiche. Completion Report, July 1976, 51 p. OWRT A-092-MISS(1).

Descriptors: Water law, *Prior appropriation, *Mississippi, Legal aspects, *Water rights, *Riparian rights, Permits, *Regulation, State governments, *Diversion, Administration.

Surface water rights and the administration of Mississippi's water appropriation system are discussed. Mississippi has adopted a prior appropriation system to regulate the use of surface waters. A permit system was initiated to protect vested riparian rights and to prohibit the total depletion of stream flow. However, riparians may not exercise their rights without either a judicial determination of their rights or a permit to exercise them. A water right under the Mississippi prior appropriation system, whether it belongs to a riparian claimant or a permittee, is defined as a certain maximum quantity of water, to be diverted at a certain maximum rate of diversion, during a stated time, at a specific point of diversion, applied to a specific parcel of land for a specified purpose. There is a priority system established for permittees in terms of time but none for use and almost any use could be beneficial use as long as the Board of Water Commissioners approves it. Ground water and diffused surface water sources are specifically excluded from the law. Domestic uses are excluded as are operations for the dredging or washing of sand and gravel. The prior appropriation system in Mississippi even with its comprehensiveness and flexibility, is subject to various criticisms.

LEGAL INSTITUTIONS FOR THE ALLOCATION OF WATER AND THEIR IMPACT ON COAL CONVERSION OPERATIONS IN KENTUCKY,
Kentucky Univ., Lexington.
R. C. Ausness, G. W. Callahan, S. W. Dills, B. H. Flynn, and J. S. Gillig.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-256 796 $7.50 in paper copy, $3.00 in microfiche. Kentucky Water Resources Research Institute, Lexington, Research Report No. 95, August 1976. 186 p, 3 fig., append. OWRT A-060-KY(2), 14-31-0001-5017, 14-34-0001-6018.

Descriptors: Legal aspects, Legislation, Water law, *Water policy, Water resources development, *Kentucky, Water rights, Riparian rights, Prior appropriation, *Water allocation(Policy), *Consumptive use, *Regulation, *Water permits, Legislation.
Identifiers: *Coal conversion operations, *Administrative permit system.

The conversion of coal into other types of fuel through gasification and liquefaction has been proposed as a means of coping with America's increasing energy needs. Coal conversion plants require large quantities of water for cooling purposes and for use as a raw material. Three types of water allocation are presently used in the United States, riparianism, prior appropriation, and administrative permit systems. The common law riparian system is undesirable because under it water rights are insecure and subject to locational use restrictions. Prior appropriation is better, but the permanent water right created under this system results in excessive rigidity. A system of administrative regulation by means of a consumptive use permit system offers the best allocation framework for both coal conversion facilities and other water users as well. Kentucky presently has such a system of administrative allocation. However this legislation could be improved by (1) clarifying the planning functions of the Department for Natural Resources and Environmental Protection and the Water Resources Authority (2) expanding the scope of the consumptive use permit system by removing most of the exempted use categories; (3) adopting beneficial use as the basis upon which consumptive use permits will be granted. (4) imposing a durational limit on water use permits and delineating renewal procedures. (5) adopting a scheme for transfers of water rights. (Huffsey-Kentucky)

6F. Nonstructural Alternatives

LAND PRICES IN FLOOD HAZARD AREAS: APPLYING METHODS OF LAND VALUE ANALYSIS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Economics.
D. Damianos, and L. A. Shabman.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-256 233 $4.00 in paper copy, $3.00 in microfiche. Virginia Water Resources Research Center, Blacksburg, Bulletin 95, April, 1976. 48 p, 2 tab, 3 fig, 50 ref, append. OWRT A-054-VA(3).

Descriptors: *Flood control, Management, Economics, Land use, *Prices, Risks, *Flood plain insurance, Non-structural alternatives, *Flood damage, *Flood plain zoning, Market value, Statistical methods.
Identifiers: Flood insurance programs, *Flood hazard, *Residential land prices.

A case study approach was used to examine the influence on residential land prices of two factors (1) the presence of flood risk, and (2) the employment of structural or non-structural measures designed to minimize flood losses. The purpose was to see whether the influence of such factors on land price could be isolated. Information of this kind would be useful in developing flood management policies that could lead to public support of the most efficient mix of alternative for reducing flood damages. The market value of land, as used in this study, is defined within the context of a economic theory of land rent. The principal effort of the investigation was a statistical analysis of land sale prices directed toward isolating the influence of flood hazard. Two separate techniques of land value analysis were used. Results were generally consistent with the hypothesis that land sale prices directed toward isolating the influence of flood hazard. Two separate techniques of land value analysis are used. Results were generally consistent with the hypothesis that land sale price is negatively related to the potential of flood damage, and that erection of structural flood control measures enhances land prices. However, it was impossible to isolate the influence of flood plain zoning measures on land prices. For this a

r reasons the results are not considered con-
ve enough to support definitive policy conclu-
s. As a guide to further research in this area,
echniques used in this study are critiqued and
in conclusions are drawn.

6G. Ecologic Impact Of Water Development

POLITICAL RESOLUTION OF ENVIRONMENTAL CONFLICTS,
Waterloo Univ. (Ontario). Dept. of Systems Design.
K. W. Hipel, R. K. Ragade, and T. E. Unny.
Water Resources Bulletin, Vol. 12, No. 4, p 813-827, August 1976. 2 fig, 9 tab, 17 equ, 4 ref.

Descriptors: *Water resources, *Management, *Water pollution, *Political aspects, *Decision making, *Linear programming, Economic feasibility, Treatment facilities, Optimization, Wastes, Sewers, Environmental control, Equations, Mathematical models, Systems analysis.
Identifiers: *Metagame analysis, Bargaining process, Profit maximization.

Many water resources management problems ultimately require a political decision in order to formulate a course of action to follow. Metagame analysis is a nonquantitative technique that can model the decision-making process and is used herein to arrive at a politically feasible solution to a typical water pollution problem. The output from the linear programming formulation of the problem is used as input to the 'political' metagame analysis. This allows a solution to the pollution conflict that is not only physically and economically feasible according to the linear programming analysis, but politically feasible as well. (Bell-Cornell)
W76-11129

IMPACT STATEMENT FOR THE AQUATIC PLANT-CONTROL PROGRAM-STATE OF TEXAS,
Army Engineer District, Galveston, Tex.
C. Novosad, W. T. Nailon, and E. O. Gangstad.
In: Aquatic Plant Control Program: Integrated Control of Alligator Weed and Water Hyacinth in Texas, Army Engineer Waterways Experiment Station, Vicksburg, Miss., Technical Report No. 9, March 1975, p. B3-B8. 6 ref.

Descriptors: *Aquatic weed control, *Herbicides, *Environmental effects, *Water hyacinth, *Alligatorweed, *Texas, Biocontrol, 2,4-D, Chemcontrol, Water pollution control, Toxicity, Safety, Spraying, Pesticide residues, Potable water, Biodegradation, Hazards.
Identifiers: Silvex, Environmental Impact Statement, Agasicles hygrophila.

The environmental impact of the Texas water hyacinth and alligator weed control program is evaluated. The program is restricted to the use of Agasicles hygrophila, the flea beetle for alligator weed control and one of the amine salts and the butoxyethanol ester of 2,4-D; some critical areas will be controlled with the PGBEE of silvex. The beneficial effects are that weed elimination will improve water quality, reduce impediments to navigation, flood control, irrigation, and recreation, and aid fish and wildlife management and disease-vector control. There are no known detrimental effects of 2,4-D usage. The adverse effect may be that dying vegetation may temporarily deplete the dissolved oxygen and deleterious to fish. The

LIBRARY U. OF I. URBANA-CHAMPAIGN

amine salt and butoxyethanol ester of 2,4-D are extremely toxic to many broadleaf plants but suitable application methods, observance of season, and atmospheric conditions will minimize drift. Precautions will be taken to keep 2,4-D concentrations in water below 0.5 ppm near estuaries. Treatment may be needed to remove tastes and odors inducted by the herbicides in potable water; but 2,4-D does not degrade to form 2,4-dichlorophenol and does not impair drinking water when used according to prescribed limitations. VALUING LONG-RUN ECOLOGICAL CONSEQUENCES AND IRREVERSIBILITIES,
Maryland Univ., College Park. Dept. of Economics.
A. C. Fisher, and J. V. Krutilla.
In: Cost Benefit Analysis and Water Pollution Policy, Environmental Protection Agency and Urban Institute Symposium, September 5-7, 1973, Annapolis, Md. Published in 1975, p. 271-290. 25 ref.

Descriptors: *Cost-benefit analysis, *Pollution abatement, *Evaluation, *Environmental effects, *Conservation, Theoretical analysis, Investment, Welfare(Economics), Discount rates, Projections, Decision making, Protection.
Identifiers: *Evaluation of irreversible pollution, Option value.

A theoretical approach, illustrated by examples, considers the nature and the implications, for economic theory and policy, of investments in water (and other) resources that may involve adverse effects on the physical environment that are either difficult or impossible to reverse. The problem has a duality in that investments in abatement of environmental disruption are made within some known period of time, 'not investing' is then irreversible, in the sense that if the investment in abatement is not made within this period, it will not be possible to make it and to capture the benefits later. The discussion attempts to indicate the nature of the long-run or irreversible ecological consequences--how they differ from the consequences of ordinary economic decisions, and to derive some modeled implications for policy with respect to investments which can either give rise to these irreversible effects or, alternatively, avert them. Related issues such as the choice of welfare criteria, the choice of discount rate, the role of uncertainty, and option value are also considered. (See also W76-11153) (Auen-Wisconsin)

PROCEEDINGS OF THE SYMPOSIUM ON OFFSHORE OIL POTENTIAL AND RELATED LAND USE IMPACTS IN THE CENTRAL CALIFORNIA COASTAL ZONE.
California Univ., Santa Cruz, Coastal Marine Lab.
Proceedings of the Symposium on Offshore Oil Potential and Related Land Use Impacts in the Central California Coastal Zone, held Santa Cruz, Calif. on June 8, 1975. Also as Calif. Univ. Coastal Marine Studies Special Publication No. 3. Doyle, W. T. (ed.)

Descriptors: *Continental shelf, Resources development, *Oil industry, Water resources, *Environmental effects, Drilling, Offshore platforms, *California, *Land use, Legal aspects.
Identifiers: *Outer Continental Shelf, Offshore technology.

The proceedings includes presentations and question and answer remarks from a symposium held on June 8, 1975, at the University of California/Santa Cruz. Following opening remarks papers were presented on: Tectonic and Basin Development of the Central California Coastal Area by Eli Silver; Estimating Potential Oil Resources in the Central California Coastal Zone by James Taylor, Offshore Petroleum Extraction and Onshore Facilities by Darrell Warner; Potential Land Use Conflicts Resulting from Offshore Drilling in the Central California Coastal Area by James Pepper; Legal Issues of Regulating the Coast by Gerald Bowden; and Panel Question and Answer Session by all authors. FLORIDA COASTAL POLICY STUDY: THE IMPACT OF OFFSHORE OIL DEVELOPMENT,
Florida State Univ., Tallahassee. Dept. of Urban and Regional Planning.
A. L. Pearman, and J. W. Stafford.
Florida State University and University of South Florida, Final Report, December 1975. (Reprinted: June, 1976). 273 p, 114 ref.

Descriptors: *Continental shelf, *Oil spills, *Oil pollution, *Resources development, *Environmental effects, *Offshore platforms, *Florida, Water resources, Pipelines, Drilling, Aquatic environment, Aquatic habitats, Aquatic life, Estuaries, Bays, Coasts, Exploration, Exploitation, Fish, Reptiles, Mammals, Remote sensing, Grasses.
Identifiers: *Outer Continental Shelf, *Deepwater ports, Environmental impacts, Coastal management.

Offshore oil and gas developments are examined from a number of perspectives: economic, environmental, legal, and social. The study is designed to identify a set of policy alternatives which can be implemented to guide and regulate onshore developments so as to minimize the adverse impacts upon the areas most directly effected. The analysis of onshore impacts is base in part, upon a review of similar developments other coastal areas. The development of an info mation base which can be applied to potent developments in Florida is viewed as an essent element of this study. The main report consists ten chapters which present the major findings a recommendations of the study. The ten chapte are: Introduction, Review of Offshore Explorati in Florida, Facilities Associated with Offshore and Gas Development, Socio-Economic Impac of Offshore Oil and Gas Development: Scenario, The Impact on Local Governme Revenues and Expenditures, Environmental I pacts of OCS Oil and Gas Activity, Environmen Impacts and Monitoring of Oil and Gas Pipeline A Technical Note; Deepwater Ports: Policy Iss in Florida, Offshore Reserves and Fuel Availab ty; and Conclusions and Recommendations. T general conclusion derived from a review of potential environmental impacts of OCS oil relat activity is that planning can minimize the negat environmental impacts by: prohibiting the most o fensive or troublesome activities; controlling t location of activities permitted and controlling t volume and frequency of operations potential p ing critical threats of environmental degradati (See also W76-11469 thru W76-11474) (Sinha OEIS)

aters, Gas industry, Policies, Petroleum, Coastal
one Management.

he nature and characteristics of offshore and
shore facilities associated with exploratory ac-
ity is specifically examined. The impacts of ex-
oratory activity on Florida communities are also
scussed. The United States Government's
cond lease sale of acreage in the eastern Gulf of
exico off Mississippi, Alabama and Florida, the
-called MAFLA area in 1973 is of special in-
est to Florida because of the 87 tracts, 62 are
ated adjacent to state waters. The relatively
all, but positive, economic impact of OCS ex-
oration on Florida coastal communities is in con-
st to the reduction in possible state revenues
sulting from the failure of recent exploratory ef-
ts initiated by the MAFLA sale. The changing
luation of Florida offshore tracts suggest that
timing of state lease sales may be critical.
owever the risks and uncertainties which charac-
ize policies permitting and encouraging rapid
oloitation of state offshore lands are likely to be
acceptable for a state which places a high value
maintaining a high level of environmental quali-
A more cautious leasing policy would be based
on an evaluation of any OCS discoveries prior
any extensive exploration of state lands. This
oroach would permit the incorporation of ex-
itation of state lands into an existing infrastruc-
e designed to accomodate offshore activity.
e current low valuation of Florida offshore
ds suggests that a more cautious state leasing
icy involves, at the worst, relatively small
ential sacrafice in terms of foreign revenues.

ENVIRONMENTAL IMPACTS AND MONITORING OF OIL AND GAS PIPELINES: A TECHNICAL NOTE,
University of South Florida, Tampa. Dept. of Geography.
L. Limoges.
In: Florida Coastal Policy Study: The Impact of Offshore Oil Development, December 1975. p 163-191, 3 tab.

Descriptors: *Florida, *Continental Shelf, *Resources development, *Environmental effects, *Oil industry, Pipelines, Estuaries, Marshes, Aquatic life, Remote sensing, Monitoring.
Identifiers: *Outer Continental Shelf, Gas industry, Coastal zone management, *Environmental impact, Pipeline corridors.

The possible effects of pipeline corridors in both estuarine and marshland environments in Florida are evaluated. The discussion includes information on the survey of sediment deposits and terrestrial and marine life as applied to the selection of possible corridor routes. The potential impact of pipeline construction activity and the various techniques for monitoring the designation of sites as well as the projected completed pipelines are outlined. Details are given on remote sensing techniques for designating and monitoring pipeline corridors. (See also W76-11468) (Sinha - OEIS)

DEEPWATER PORTS: POLICY ISSUES IN FLORIDA,
Florida State Univ., Tallahassee Dept. of Urban and Regional Planning.
A. Dzurik.
In: Florida Coastal Policy Study: The Impact of Offshore Oil Development, December 1975. p 193-222, 3 tab, 1 map.

Descriptors: *Florida, *Continental Shelf, *Oil industry, *Resources development, Water resources, Water resources, *Environmental effects, Coasts, Facilities.
Identifiers: *Outer Continental Shelf, *Supertankers, *Deepwater ports, Refineries, Onshore facilities, Gas industry, Coastal Zone Management.

An overview of the possible use of supertankers off Florida's shores is provided. Policy issues associated with deepwater ports are specifically dealt with. It is concluded that the potential for deepwater port development is closely tied to the needs and expectations of the petroleum industry, but it is also subject to economic, legal and political constraints. Without major refineries, the development of deepwater ports is unlikely in Florida. (See also W76-11468) (Sinha - OEIS)

BUREAU OF LAND MANAGEMENT'S ENVIRONMENTAL STUDIES PROGRAM FOR THE SOUTH ATLANTIC OUTER CONTINENTAL SHELF AREA. CONFERENCE/WORKSHOP PROCEEDINGS,
Research Triangle Inst., Research Triangle Park, N. C.
Held at Atlanta, Georgia, October 1975, Published in February 1976. 283 p. Massoglia, M. F. (Compiler)

Descriptors: *Continental Shelf, *Resources development, *Environmental effects, *Baseline studies, *Water pollution, *Conferences, *Estuarine environment, Management, Geology, Fisheries, Alaska, Oceanography, Ecosystems, Biology, Physical properties, Land management.
Identifiers: *Outer Continental Shelf, South Atlantic OCS, U.S. Southeast Coast, Georgia Embayment, Georgia Bight, Environmental impact.

The objectives of the conference/workshop, 'Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area,' were: To provide a summary of available related information and understanding for the South Atlantic Outer Continental Shelf area. To provide any predictions presently possible of the effects of drilling (exploration and development) on the environment of this area. To identify subject areas in which additional information is required for reasonable prediction and understanding for the environmental effects of drilling in this area. And to formulate recommendations for baseline studies and monitoring which will help to adequately determine the environmental effects of any oil and gas exploration and development in the South Atlantic Outer Continental Shelf area. The report contains a compilation of presentation and discussions of the conference/workshop. Pertinent papers are separately abstracted. (See W76-11475 thru W76-11485) (Sinha - OEIS)

THE DEPARTMENT OF THE INTERIOR'S OUTER CONTINENTAL SHELF LEASING PROGRAM,
Bureau of Outdoor Recreation, Atlanta, Ga. Southeast Regional Office.
J. Whelan.
In: Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area, Conference/Workshop Proceedings, Feb 1976. p 11-14.

Descriptors: *Environmental effects, *Baseline studies, *Resources development, Leases, *Continental Shelf, *Oil industry, Water resources.
Identifiers: *Outer Continental Shelf, Environmental impact, Gas industry.

As a result of the OCS Lands Act of 1953, the Department of the Interior is responsible for managing and developing the mineral resources of the Outer Continental Shelf. The Department has formulated three major goals for the comprehensive management of the OCS. They are: Orderly development of marine mineral resources to meet the energy demands of the Nation; protection of the marine coastal environment; and receipt of fair market value for the leased mineral resources. The OCS Research Management Board was created in March 1974 by the Secretary to design and implement baseline environmental studies and data-gathering and monitoring activities relating to oil and gas development on the Outer Continental Shelf. Development of the energy resources on the OCS will provide substantial benefits to the entire country in terms of secure supplies of oil and gas. However, the Department does recognize that there are risks and potential costs associated with offshore development. (See also W76-11474) (Sinha-OEIS)

Descriptors: *Environmental effects, *Baseline studies, *Resources development, *Oil industry, *Estuarine environment, *Wetlands, Land management, Leases, Management, Pipelines.
Identifiers: *Outer Continental Shelf, Environmental impact, Nearshore environments.

The Environmental Studies Project encompasses a wide variety of field, laboratory, and review stu-

UNIV. OF ILLINOIS-URBANA-CHAMPAIGN

dies designed to gather information about the physical, chemical, biological, and geological aspects of the OCS, nearshore, and wetland/estuarine environments. It was established to support the BLM OCS-leasing program by providing data on which more informed management decisions could be based. Information from these studies can be (and is) used for tract selection, environmental impact statement (EIS) preparation, and preparation of special lease stipulations before leasing. After leasing, the data are used for assessing changes resulting from exploration and development activities; this information will affect operating orders, in the short turn, and, in the long turn, will be the basis for modification of leasing and operating regulations and for pipeline management. SOUTHEAST COASTAL RESEARCH ACTIVITIES OF ERDA,
Division of Biomedical and Environmental Research (USERDA), Washington, D. C.
W. O. Forster.
In: Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area, Conference/Workshop Proceedings, Feb 1976. p. 29-37, 5 tab.

Descriptors: *Continental Shelf, *Ecosystems, *Resources development, *Oil industry, *Water resources, *Environmental effects, Leases, Land management, Coasts, Geology, Biology, Geochemistry, Oceanography, *Southeast U.S.
Identifiers: *Outer Continental Shelf, South Atlantic Coast, Georgia Bight.

The research program that ERDA is developing on the southeast coast is complimentary, not competitive with BLM's plans. The individual components of the overall southeast coastal program are the physical, the geochemical, the geological, and the biological programs. Each of the four programs has an emphasis on the time-related function aspect of the coastal zone as a system. The attempt is to describe the causes of such conditions. The geochemical transport program emphasizes the attempt to try to elucidate the causes of these particular parameters. The biological oceanography program is perhaps the most important of all. The impact of any activities in the coastal zone will have to be assessed in terms of the biological oceanographic aspect. The program that evolved is divided into five categories: hydrodynamic modeling; physical, geochemical, and biological oceanography; and the coordination of these projects. These studies must be multidisciplinary, laboratory, field, and experimental-ecosystems type. The environmental impacts will be greater with petroleum discharge and impacts on the nearshore area rather than offshore; therefore, highest priority for chronic effects studies should be in the nearshore zone. (See also W76-11474) (Sinha-OEIS)
W76-11477

THE ALASKAN OUTER CONTINENTAL SHELF ENVIRONMENTAL ASSESSMENT PROGRAM,
National Oceanic and Atmospheric Administration, Boulder, Colo. Outer Continental Shelf Environmental Assessment Program.
D. A. Wolfe.
In: Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area, Conference/Workshop Proceedings, Feb 1976. p 39-53, 2 fig.

Descriptors: *Continental Shelf, *Alaska, *Environmental effects, *Ecosystems, *Oil industry, *Baseline studies, *Resources development, Land management, Monitoring, Leases, Biology, Geology, Chemistry, Oceanography, Water resources.
Identifiers: *Outer Continental Shelf, Gas industry, Environmental impact.

The baseline studies for the Alaskan OCS are being managed for the Bureau of Land Management entirely by NOAA. NOAA is responsible for designing the research program, contracting for the research projects, monitoring progress, assuring quality of the data, and performing the analyses to be contained in the reports to BLM. The objectives of the Outer Continental Shelf Environmental Assessment Program are: Identify critical species, habitats, and processes and determine their susceptibility to petroleum development; identify sources and characterize them, including determination of the critical components of petroleum; quantify the transport mechanisms - concentrators, diffusers, and translators; quantify effects levels on individuals; relate the individual to his species and his species to the ecosystem, especially with intent to identify irreversible effects; develop and initiate a monitoring program based upon an understanding of the relations of biota to their physical environment; characterize the physical environment to provide data needed by licensing and regulatory agencies (Interior, Transportation) for judgment as to engineering design adequacy; provide timely input at all stages of BLM leasing and operations and provide timely assessment of alternatives; provide data format and storage such that data are easy to recover and amenable to analysis; and provide the best possible overall science while accomplishing the BLM mission. (See also W76-11474) (Sinha-OEIS)
W76-11478

ENVIRONMENTAL PROTECTION AGENCY'S ROLE, INTERESTS, AND RESPONSIBILITIES WITH RESPECT TO THE OUTER CONTINENTAL SHELF DEVELOPMENT,
Environmental Protection Agency, Johns Island, S. C. Office of Research and Development.
W. P. Davis.
In: Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area, Conference/Workshop Proceedings, Feb 1976. p 55-58.

Descriptors: *Continental Shelf, *Ecosystems, *Environmental effects, *Oil spills, Ecology, *Waste disposal, *Water quality control, *Resources development, Water resources, Land management, Management, Southeast U.S.
Identifiers: *Outer Continental Shelf, South Atlantic Coast, Georgia Bight, Georgia embayment, Environmental impact.

The U.S. Environmental Protection Agency's role with respect to OCS has been associated with efforts to develop a scientific basis for management decisions. Energy development and sound environmental interests need not be incompatible on the OCS issue. There are many ways in which EPA is directly or indirectly involved in the entire gamut of OCS operations in the broadest sense. EPA is concerned with ocean disposal; EPA performs an advisory role with respect to oil spills; the Narragansett Environmental Research Laboratory has the mission to supply scientific basis for establishment of marine water quality standards for petroleum; Gulf Breeze Environmental Research Laboratory has the mission to supply scientific basis for establishment of marine water quality standards for petroleum and in addition conducts work in the ecological effects of man-produced organic compounds in marine/estuarine ecosystems. Finally EPA has the responsibility to maintain one of the finest coastal areas of the United States. (See also W76-11474) (Sinha-OEIS)

OFFSHORE OPERATIONS, REGULATION AND ENVIRONMENTAL PROTECTION,
Exxon Co., New Orleans, La. Southeastern Div.
R. R. Hickman.
In: Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area, Conference/Workshop Proceedings, Feb 1976. p 63-68.

Descriptors: *Continental Shelf, *Environmental effects, *Resources development, *Oil industry, *Pollution abatement, Exploration, Operations, Drilling, Safety, Offshore platforms, Pipelines, Oil pollution
Identifiers: *Outer Continental Shelf, Gas industry, Offshore technology

In order to better understand the environmental impact of operations, the oil and gas industry has funded studies such as the recently completed 2-year Offshore Ecology Investigation undertaken by the prestigious Gulf Universities Research Consortium, with 23 principal scientists from 11 universities and two nonprofit research institutes participating, the study showed that there was no harm done in the 400 square nautical miles (1,370 sq km) study area off Louisiana despite the fact that extensive operations there have been going for more than 25 years. Seasonal changes resulted in a significantly greater variability in all of the data than could be ascribed to the presence or absence of petroleum operations. Offshore petroleum operations are providing important energy supplies to the United States. In all phases of this activity, including exploration, field development, and production, environmental protection is a key consideration. Protective measures include personnel training, elaborate safety equipment, automatic controls, and back-up equipment. An overall good record of past performance offshore will be enhanced in the future by continuing technological improvement, by effective regulation, and by the industry's determination to protect the environment wherever it operates. OVERVIEW OF CONFERENCE PROGRAMS,
Skidaway Inst. of Oceanography, Savannah, Ga.
D. Menzel.
In: Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area, Conference/Workshop Proceedings, Feb 1976. p 93-96.

Descriptors: *Continental shelf, *Environmental effects, *Ecosystems, *Resources development, *Oil industry, *Pollution abatement, *Baseline studies, Exploration, Drilling, Leases, Land management, Southeast U. S.
Identifiers: *Outer Continental Shelf, *Gas industry, Environmental impact.

The guidelines of the conference are as follows: To provide a summary of available related information and understanding for portions of the southeast Continental Shelf; to provide any predictions presently possible on the effects of drilling (exploration and development) on the environment in this area; to identify subject areas in which additional information is required for reasonable prediction and understanding of the environmental effects of drilling; and to formulate recommendations for baseline and monitoring programs which will help to determine adequately the environmental effects of oil and gas exploration and exploitation in the South Atlantic Outer Continental Shelf region. The BLM is specifically concerned with the potential impacts of activities on and around drilling platforms, including any effect such activities might have on the surrounding ocean or shoreline. ration and development has potential for ng contamination into the area. This con-ation is in two forms; temporary contami-from drilling operations and long-term con-nts from the rig itself or the material it on the bottom. Contaminants can enter the nment at the surface through water ns, but more importantly they probably at the bottom. Any data that can be used to t or model where instantaneous spills or in-neous and long-term contamination can become important. The problem is inter-inary in nature. Transport can be by organ-by absorption, or by almost any phenomena n pick up and move contaminants. It ap-hat there are not enough environmental data vide a good handle on the environmental in the area. If transport is considered to be in problem, there are not enough data to p good models or good prediction methods. e data from satellites and over-flights may ficient to generate a predictive ability for spills. The amount of bottom-current data gnificant, and yet, if you examine the ns that we are facing, bottom transport may be the most important thing we are looking at. (See also W76-11474) (Sinha - OEIS)

BIOLOGICAL CONSIDERATIONS,
Duke Univ., Beaufort, N. C. Marine Lab.
R. T. Barber.
In: Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area, Conference/Workshop Proceedings, Feb 1976. p 109-112.

Descriptors: *Continental Shelf, Ecology, *Environmental effects, *Oil spills, Ecosystems, Water pollution, *Resources development, *Baseline studies, *Advection, Shellfish, Fisheries, *Estuaries, Circulation, Nutrients, Biology, Beaches, Southeast U. S.
Identifiers: *Outer Continental Shelf, *Environmental impact, *Bottom transport, *Gulf Stream, South Atlantic Coast, Georgia embayment.

The Outer Continental Shelf of the South Atlantic region is dominated by advection, that is, the major property in determining the chemical and biological character of the water column is the horizontal along-shelf and cross-shelf circulation. Intermittent intrusions of deep water from the Gulf Stream onto the shelf produce a shoreward bottom current, which is the principal source of nutrients for the shelf community. The research necessary for establishing the baseline ecosystem character and predicting the ecosystem response to modification must be built around this time-varying advective character. The present idea of how the stock of the calico scallop fishery is maintained is that the adults off North Carolina are recruited from larvae spawned off the coast of Florida and carried north. The advective larval transport system, which the proposed lease area sits astride and which connects the Floridian fauna to its further extensions off the coasts of Georgia, South Carolina, and North Carolina, is clearly the most vulnerable component of the ecosystem and the one most likely to be impacted by the proposed development. A spill or accident occurring in the absence of a Gulf Stream intrusion may be diluted and advected out of the system without detectable impact on the biota, while the same event occurring during a period of strong bottom flow across the shelf or during a period of strong onshore winds could product marked effects over a wide zone projecting from the spill site shoreward as far as the beach or estuary. CONCLUSION AND RECOMMENDATIONS CONFERENCE/WORKSHOP,
Skidaway Inst. of Oceanography, Savannah, Ga.
D. Menzel.
In: Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area, Conference/Workshop Proceedings, Feb 1976. p 227-250.

Descriptors: *Continental Shelf, *Resources development, *Environmental effects, *Oil pollution, *Metals, *Ecosystems, *Water pollution effects, *Oil industry, Hazards, Geology, Biology, Oceanography, Meteorology, Safety, Leases, Conferences, Land management, Biota, Fisheries, Southeast U. S.
Identifiers: *Outer Continental Shelf, *Hydrocarbons, Georgia Embayment, South Atlantic Coast, Georgia Bight.

Conclusions and recommendations developed by the conference/workshop are summarized and discussed. There was a charge from the floor to establish study priorities based on possible impacts, which might exert a long-term effect on man or an irreversible effect on the environment. The following concerns were considered of major importance. (1) The possibility of accidents resulting from geological hazards; (2) Permanent destruction of unique environments; and (3) The effects of metals and hydrocarbons on organisms and the possible return of these elements/compounds to man. In keeping with the conclusions, it was determined that the recommendations developed in the individual workshops should be prioritized by considering the direct impact on man and the environment of any oil and gas development activities; weighting them according to the irreversibility of the impact; and assembling them into interdisciplinary packages. Within this general framework three priority groups were defined. Baseline, Direct Impact on Man: seismology and identification of faults and positions of aquifers, and test drillings to correlate with such a study; side-scan sonar mapping to identify hard bottom areas; inventory of metals and hydrocarbons in water, animals, and sediments; inventories of seasonal abundance of birds, mammals, and reptiles; inventories of benthic organisms in direct support of same locations; trajectories and net transport of water; management of background and historical data; coordination of activities associated with fish populations currently being conducted by Federal, State and private agencies; beach survey for tarballs; and chemistry of suspended particulates. Predictive Studies: fate of oil in marshes, shelf, and open ocean; and fate of metals in marshes, shelf, and open ocean. The third group contains all others. (See also W76-11474) (Sinha-OEIS)

DECISION THEORY AND ITS APPLICATION TO NETWORK DESIGN,
Geological Survey, Reston, Va.
M. E. Moss.
In: Hydrological Network Design and Information Transfer; Proceedings of international seminar, held at Newcastle upon Tyne, U K, August 19-23, 1974: World Meteorological Organization Operational Hydrology Report No 8 (WMO No 433), p 23-25, 1976. 8 ref.

Descriptors: *Network design, *Data collections, *Statistical methods, *Decision making, Methodology, Regression analysis, Probability, Optimization.
Identifiers: *Bayes theorem, Subjective probabilities.

A brief description of the pros and cons of the use of classical statistics (non-Bayesian) in network design is presented. In classical statistics, the statistician is not concerned with the eventual decision that may be based on the results of an analysis. The classicist applies a rigorously derived formulation to an existing set or sets of data and might state something to the effect that at the 95 percent confidence level there is no difference between the means from which two samples were drawn, or he might state that there is a probability of 99 percent that the true mean from which a sample was drawn lies between two particular values. The classicist can specify the types of tests used in his analysis and provide another statistician with his data and the two will obtain exactly the same results. Thus classical statistics is both rigorous and reproducible and, if it is used to formulate network design strategies, each designer would arrive at the same network if all used the same data. On the other hand, if classical statistics are used in network design, the ultimate goal of providing optimum levels of information is in all likelihood not reached because the uses to which the data will be put are not incorporated into the procedure. Surrogate measures such as conficence bands or accuracy statements become the parameters of the design criteria. (Woodard-USGS)

INFORMATION TRANSFER FOR STREAM DISCHARGE,
Geological Survey, Reston, Va.
M. E. Moss.
In: Hydrological Network Design and Information Transfer; Proceedings of international seminar, held at Newcastle upon Tyne, U K, August 19-23, 1974: World Meteorological Organization Operational Hydrology Report No 8 (WMO No 433), p 119-128, 1976. 2 fig, 3 tab, 7 ref.

Descriptors: *Network design, *Flow characteristics, *Gaging stations, *Regression analysis, Estimating streamflow, Sites, Probability, Optimization, Computer programs.
Identifiers: *Ungaged stream sites.

The need for mechanisms by which information pertaining to streamflow can be transferred from one or more sites to sites at which little or no data are available becomes obvious if it is technically impossible to perfectly anticipate demands for streamflow information, and economically impossible to gauge at every conceivable site. Network design by the use of regression-analysis simulation is thus a viable tool that can be considered in the expansion of existing streamflow-data networks. At present, however, the method cannot be applied in areas where existing data are not sufficient to perform an initial regression analysis because of lack of knowledge concerning the underlying model errors contained in the regression. Plans are under way to remedy this by posterior analysis of the results obtained using the method in the United States and elsewhere in the world. An additional limitation may arise when the existing catalogue does not cover the range of parameters required for the system under examination. Under such a circumstance computer programs can be made available for the extension of the catalogue. These extended results can be added to existing catalogues so as to minimize the likelihood that future users will encounter such limitations. (Woodard-USGS)

DESIGN OF POLLUTANT ORIENTED INTEGRATED MONITORING SYSTEMS,
Environmental Protection Agency, Las Vegas, Nev.
E. A. Schuck, and G. B. Morgan.
In: International Conference on Environmental Sensing and Assessment, Vol. 2, September 14-19, 1975, Las Vegas, Nevada, p 20-6-1 - 20-6-6. 8 fig, 11 ref.

Descriptors: *Monitoring, *Systems analysis, *Water pollution effects, *Lead, *Flow, *Water pollution sources, Path of pollutants, Runoff, Analytical techniques, Evaluation.

The use of an integrated monitoring systems approach for assessing the sources and environmental impact of specific pollutants is discussed. The integrated monitoring systems approach simultaneously takes into account the critical receptors, critical transport pathways, and critical sources. The use of the integrated monitoring systems approach for illustrating the flow of lead from sources through various environmental pathways and its interaction with a critical receptor (an urban child under 6 years of age) revealed that lead from drinking water sources represents a minor contribution to exposure, except in small isolated areas, since most of the particulate lead in the environment is largely in an insoluble form. A flow diagram of the fate of lead contributed from an automotive fleet reveals that street runoff into coastal waters accounts for only about 2% of the total lead emitted. The application of the integrated concept to the test case demonstrated the inability of conventional chemical and physical methods for monitoring total exposure of a critical receptor. PROGRAMMABLE CALCULATORS: MODERN INSTRUMENTS FOR ANALYZING HYDROLOGIC DATA,
Geological Survey, Tallahassee, Fla.
D. V. Maddy.
Open-file report 75-642, December 1975. 24 p, 15 fig, 2 ref.

Descriptors: *Data processing, *Data collections, *Hydrologic data, *Data transmission, *Systems analysis, Surface water, Groundwater, Hydrology, Data storage and retrieval, Instrumentation, Telemetry.
Identifiers: *Programmable calculators.

The programmable calculator has become a valuable addition to the set of modern instruments that a hydrologist has at his disposal for the analysis of hydrologic data. The programmable calculator may be used to compute discharge measurements, to compute daily discharges from gage heights and shifts, to compute duration values, to compute discharge of flow through a venturi constriction, to compute values of production and respiration for oxygen metabolism studies, and to perform many other data analysis tasks. The programmable calculator can store and retrieve various kinds of data, can prepare summary tables of ground-water and surface-water elevations, and can plot graphs of various parameters. The programmable calculator's versatility is almost unlimited and allows data handling on a current basis. (Woodard-USGS)

WATER CURRENT FORCE MEASURING APPARATUS,
S. J. Niskin.
U. S. Patent No. 3,955,412, 3 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 946, No 2, p 497, May 11, 1976.

Descriptors: *Patents, *Currents(Water), *Water circulation, *Water level fluctuations, Ocean currents, Current meters, Tidal effects, Cycles, Strain gages, Strain measurement, Instrumentation, Energy, Kinetics.

A water current force measuring apparatus consists of a pliable rope or line suspended in the water with its lower end anchored to the bottom while the length of the line is subjected to the forces of the current. The upper end of the line is secured to a tensiometer or strain gauge, which in turn is connected to a float or a series of interconnected buoys or floats. Those floats that submerge, balance the total horizontal current-generated force or drag on the line, which is recorded on the tensiometer. These readings are a measure of the total current forces acting on the line by the surface and subsurface currents to permit the ready determination of the total kinetic energy of the currents. Upon obtaining continuous readings of the strain gauge over a definite period, wave heights and lenghts,as well as tidal and other cyclic and non-cyclic water movements of the body of water can be ascertained. SOURCES OF WATER QUALITY, LAKE LEVEL, ICE, WATER TEMPERATURE, AND METEOROLOGICAL DATA FOR THE ST. LAWRENCE GREAT LAKES,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
A. M. Beeton, and J. W. Strand.
University of Wisconsin-Milwaukee (Wisconsin), Advisory Report No. 10, 193 p, January, 1975. 5 fig, 8 ref, 5 tab.

Descriptors: *Great Lakes, *Hydrologic data, *Meteorological data, Stations, *Data collections, *Water quality, Canada, United States, Weather data, On-site data collections, Intakes, Water chemistry, Lake Superior, Lake Michigan, Lake Ontario, Lake Huron, Lake Erie, Weather data, Chemical properties, Physical properties, Biological properties, Sampling.

This 2-part report lists data sources around the Great Lakes (in both Canada and the United States) collecting hydrographic and meteorological data. Data sources for hydograghic information are municipal, industrial, power plant, and military water treatment plants. The hydrographic section identifies the data source (along with address, telephone number, and person to contact), gives information on the physical structure of the water intake, indicates what specific chemical, physical, biological, and radiological measurements are made on the raw (untreated) water, shows the period of record, and the availability of the data. The meterological section lists weather stations around the Great Lakes up to a distance of 125 miles inland and their location (latitude and longitude) and elevation, agency to contact when requesting data, period of record, and type of data collected (e.g., air temperature, relative humidity, precipitation, solar radiation). GROUND-WATER RECORDS FOR NORTHEASTERN OKLAHOMA: PART 1--RECORDS OF WELLS, TEST-HOLES, AND SPRINGS,
Geological Survey, Oklahoma City, Okla.
J. S. Havens, and D. L. Bergman.
Open-file report, March 1976. 100 p, 33 ref.

Descriptors: *Groundwater, *Basic data collection, *Water wells, *Well data, Test wells, Springs, Aquifers, Water yield, Water levels, Water utilization, Bibliographies, Publications, *Oklahoma.
Identifiers: Northeastern Oklahoma.

The U. S. Geological Survey has collected data on Oklahoma's ground-water resources since 1934. Most of these data were collected as part of specific ground-water studies conducted in cooperation with various Federal, State, and local agencies. This report includes published and unpublished records of approximately 3,360 wells, test-holes, and springs for 23 counties in northeastern Oklahoma. In addition, selected references to pertinent ground-water reports covering parts of the 23-county area are presented. (Woodard-USGS)
W76-11412

HYDROLOGIC DATA FOR URBAN STUDIES IN THE SAN ANTONIO, TEXAS METROPOLITAN AREA, 1974,
Geological Survey, Austin, Tex.
V. Gonzalez.
Open-file report, May 1976. 109 p, 1 fig, 5 tab.

Descriptors: *Storms, *Rainfall-runoff relationships, *Water quality, *Small watersheds, *Urban runoff, Texas, Hydrologic data, Streamflow, Rain gages, Gaging stations, Peak discharge, Path of pollutants, Chemical analysis, Hydrographs, Mass curves.
Identifiers: *San Antonio(Tex).

Runoff data from the San Antonio urban study area for the 1974 water year are based on discharge measurements and stage records at six continuous-record stream-gaging stations, seven crest-stage partial-record stations (flood hydrographs obtained), and water-surface elevations at eleven flood-profile partial-record stations. Storms producing the highest peak discharges in the San Antonio metropolitan area occurred on the following days: Oct. 11, 1973, and Aug. 8, 30, 1974. Weighted rainfall for these storm periods upstream from continuous-record gaging stations and selected crest-stage partial-record stations are given. Water-quality data have been collected from watersheds in various stages of urban development at most of the gaging stations in the San Antonio urban area. This water-quality program provides data on the concentration of pollutants as a result of runoff from these watersheds. In addition these data provide a relationship of water-quality parameters to discharge and seasonal conditions. (Woodard-USGS)

HYDROLOGIC RECORDS FOR LAKE COUNTY, FLORIDA, 1973-74,
Geological Survey, Tallahassee, Fla.
C. P. Laughlin, and D. M. Hughes.
Open-file report FL 75013, 1975. 72 p, 37 fig, 22 tab, 7 ref.

Descriptors: Water resources, *Basic data collections, *Surface waters, *Groundwater, *Water quality, Streamflow, Hydrogeology, Aquifer characteristics, Water wells, Water levels, Hydrologic data, Lakes, Chemical analysis, *Florida.
Identifiers: Lake County(Fla).

A hydrologic records program was begun in 1969 by the U. S. Geological Survey in cooperation with the Lake County (Florida) Board of County Commissioners, and the Oklawaha Basic Recreation and Water Conservation and Control Authority. This is the fifth annual report for the hydrologic records program; it presents and summarizes the data for 1973-74 in both tabular and graphic form. Included are stream discharge records for two water years plus a three month period (October 1, 1972 to December 1974) and groundwater and lake levels, and water quality data for May 1973 through December 1974. Also included are water levels in approximately 60 wells measured each May to obtain data for annual preparation of maps of the potentiometric surface of the Florida aquifer. A map of the potentiometric surface of the Floridan aquifer in the Leesburg area on M 17, 1974 is presented. Additional hydrologic d are included from cooperative programs betw the U. S. Geological Survey and the Southw Florida Water Management District, and Florida Department of Natural Resour (Woodard-USGS)

837-851, August 1976. 8 fig, 30 equ, 12 ref.

Descriptors: *Water distribution(Applied), *Pipes, *Networks, *Optimization, *Costs, *Hazen-Williams equation, *Environmental engineering, Design, Pipe flow, Economics, Hydraulics, Computer programs, Systems analysis.
Identifiers: Cost minimization.

A new method for a workable optimum cost solution of pipe sizes of various branches of a water distribution network with given geometry, peak demand values, and specified terminal pressure heads has been developed incorporating pipe cost function. A correction factor for flow has also been derived which, when algebraically added successively to the assumed flow values of pipes in a loop during an iteration process, results in convergence towards the solution. As theoretical least-cost solution results in the formation of a tree network, a workable optimum condition has been considered by fixing a minimum size of pipes. The integrated total cost of the system including capital and recurring cost of pumping station, elevated reservoir, and pipes has been optimized to obtain optimum inlet pressure head, pressure surface, and position of elevated reservoir for a given network. The applicability of the approach, which utilizes the Hazen-Williams equation, is illustrated with a problem. The effect of the density of population on the cost has been studied and a general computer program developed. (Bell-Cornell)

GROYNE STABILIZATION OF SLOPE MOVEMENTS AND TOE EROSION, LAKE HURON NEAR BAYFIELD, ONTARIO,
University of Western Ontario, London. Dept. of Civil Engineering.
R. M. Quigley, J. H. L. Palmer, A. Rowland, and D. Bere.
In: Proceedings, Seventeenth Conference on Great Lakes Research, Part 1; McMaster University, Hamilton (Ontario), August 12-14, 1974. International Association for Great Lakes Research, p 193-206, 1974. 9 fig, 12 ref.

Descriptors: *Groins(Structures), *Gabions, *Shore protection, *Lake Huron, Structures, Hydraulic structures, Jetties, Beaches, Beach erosion, Berms, Erosion, Erosion control, Waves(Water), Coasts, Coastal structures, Shores, Engineering.
Identifiers: *Bayfield(Ontario).

The storm of March 17, 1973 caused very severe erosion at many places along the east coast of Lake Huron. Subsequent spring wave action continued to attack the toe of many 17 m high cliffs resulting in numerous landslides, many of them encroaching on valuable cottage properties. This paper described the layout, installation, and first year performance of a system of three gabion groynes set up to protect a 122 m long section of coast already subject to severe earth movements. In the absence of adequate design information, the design was based on preliminary wind data and field observations of beach characteristics, sand availability and probable wave heights. The groynes, which were constructed during June and July 1973, were spaced about 36 m apart and extended off-shore from the cliff toe for a distance of about 18 m. The ends of the groynes, therefore, extend to the plunge point of 1.2 m high waves generated by strong trade winds and about 60% of the distance to the estimated location of the plunge point of severe storms. The beach height at the cliff toe has built itself up to 1.8 m above present water levels and provides a beach berm just adequate to stabilize the lower portions of the failing cliff behind it during the wet spring conditions of 1974. The installation has been very successful, the groynes having rapidly filled with sand and gravel. The groyne field and resultant beach prevented spring time erosion during the period from March to May 1974 and is presently considered to be performing successfully. Descriptors: *Destratification, Lakes, *Hydraulic models, *Mixing, *Design criteria, Model studies, Jets, Density stratification, *Stratification, Oklahoma.
Identifiers: *Mechanical mixing, Ham's Lake(Okla).

The investigation was undertaken to analyze the effectiveness of devices for artificially destratifying lakes. A criterion for the effectiveness of mixing was selected. This criterion was applied to a number of variations of mechanical mixing devices, to indicate trends in optimization of designs. Experiments were performed in a vertically exaggerated scale model of Ham's Lake. Destratification was accomplished by a jet of water from two different sizes of propellers in different configurations (shrouded, skirted, and free; at two depths; and with a deflector) mixing the top water with the bottom water. Data taken from the experiments include density profiles as a function of time. The data were analysed determining the change of the stability index with time.

INTERNATIONAL ASSOCIATION OF DRILLING CONTRACTORS DRILLING MANUAL,
International Association of Drilling Contractors, Houston, Tex. Rotary Drilling Committee.
International Association of Drilling Contractors, Ninth edition, 320 p., June, 1974.

Descriptors: *Drilling equipment, *Drilling, *Boreholes, *Wells, *Boring, *Rotary drilling, Core drilling, Borehole geophysics, Casing, Drilling fluids, Cement grouting, Training.
Identifiers: Drilling procedures, Drilling equipment specifications, Drilling equipment handling, Drilling equipment maintenance.

A manual of drilling equipment contains drilling system component specifications, recommended care, maintenance, and handling procedures. Detailed examples are given at the end of most chapters. A glossary of drilling terms contains the nomenclature of equipment and procedures. Some of the equipment listed are: bits, tool joints, drill pipe, casing, tubing, drill collars, kelly bars, pipe handling equipment, brakes, chains and sprockets, rotary hose, swivels, pumps, blow out prevention equipment, derricks and masts. Trouble shooting methods in the areas of hole deviation and stuck drill pipe are also explained. (Heiss-NWWA)

SMOKE TEST SEWERS TO FERRET OUT ILLEGAL INFLOW,
W. S. Foster.
American City and County, Vol. 91, No. 6, p 44, June, 1976.

Descriptors: *Sewers, *Surface waters, *Smoke, *Inflow, Analytical techniques, *Infiltration, Pipelines, Measurement, Manholes, Tests, Testing procedures.
Identifiers: Smoke tests.

The use of smoke tests to identify pathways for the infiltration and inflow of unwanted surface water into public sewer systems is discussed. Smoke tests can be performed on a single line of sewers connected by two manholes or two lines connected by three manholes if the total run is not excessive. In the former case, the smoke is injected through either manhole; in the latter case, it is introduced through the center manhole. In either case the line or lines must be blocked to confine the smoke. The smoke can be produced either by candles or bombs that generate zinc chloride mist or by dioctylphthalate aerosol. A small portable blower like the type many municipal maintenance crews customarily use is sufficient for introducing the smoke into the manhole. If smoke rises from downspouts or outside drain, this indicates illegal connections with the sewerage system. Smoke appearing at the ground surface indicates a break in the pipeline. (Kreager-FIRL)

REVIEW OF STANDARDS AND OTHER INFORMATION ON THERMOPLASTIC PIPING IN RESIDENTIAL PLUMBING,
National Bureau of Standards. Washington, D. C.
R. S. Wyly, W. J. Parker, D. E. Rorrer, J. R. Shaver, and G. C. Sherlin.
Available from the National Technical Information Service, Springfield, Va 22161, as COM-75-10769, $4.50 in paper copy, $3.00 in microfiche. Building Science Series No. 68, May, 1975. 65 p, 1 fig, 10 tab, 56 ref, append.

Descriptors: *Plastic pipes, *Drains, *Plumbing, *Water conveyance, *Plastics, Performance, Burning, Heat resistance, Thermal properties, *Reviews.

Existing information on the physical characteristics of thermoplastic piping of particular interest for its use in residential, above-ground plumbing are reviewed. Adequacy of functional performance of plumbing systems is considered from the user's viewpoint. Thin-wall poly(vinyl chloride) (PVC) drain-waste-vent systems and tube-size chlorinated poly(vinyl chloride) (CPVC) water-distribution piping in particular were studied. Acrylonitrile-butadiene-styrene (ABS) is also widely used for water distribution and drain, waste, and vent systems (DWV). The principal issues involving thermoplastics piping for above-ground plumbing include potential fire hazards, effects of hot water, potential for chemically induced cracking, effects of hydrostatic pressure and water hammer, adequacy of acoustical performance, and ability to assure critical design and installation details through routine inspection. Where thermoplastics piping is approved, there are often restrictions, including type of waste, fire rating of the building, pipe wall thickness, and height. Performance of ABS and PVC drain-waste-vent piping apparently depends to a significant degree on installation and design details. (Snyder FIRL)

LIBRARY U. OF I. URBANA-CHAMPAIGN

BACTERIA

The Importance of Inhibiting Substances in the Control of Algal and Bacterial Populations of Marine Plankton, (In French),
W76-11542 5G

Quantitative Characteristics of Distribution of Bdellovibrio Bacteriovorus in River Water, (In Russian),
W76-11551 5A

Primary Production in the Mauritanian Upwelling in March 1973, (In French),
W76-11555 5C

Features of Freshwater Ecosystems (From the Results of Soviet Participation in the International Biological Program), (In Russian),
W76-11556 5C

Study of the Behaviour of Poliomyelitis Virus Type 1 in Different Hydrous Media, (In French),
W76-11569 5A

Hygienic Problems of Large Animal Confinement,
W76-11571 5G

Petroleum-Oxidizing Bacteria Accompanying Higher Aquatic Plants, (In Russian),
W76-11572 5C

BACTERIOCENOTIC STUDIES

Bacteriocoenotic Studies on a Weakly Dystrophic Stream, (In German),
W76-11533 5C

Bacteriocoenotic Studies on an Oligotrophic Stream, (In German),
W76-11534 5C

Bacteriocoenose Studies on an Eutrophic Biotope, (In German),
W76-11535 5C

BALTIC SEA

The Baltic Sea Pollution,
W76-11185 5C

Ecology of the Littoral Polychaete Streptosyllis Websteri, A New Species in the Baltic,
W76-11186 5B

BARK

Acute Toxicities of Spruce and Hemlock Bark Extracts to some Estuarine Organisms in Southeastern Alaska,
W76-11393 5C

BARLEY

Nitrogen-Silicon Interaction in Plants Grown in Desert Soil with Nitrogen Deficiency,
W76-11509 3F

BASELINE DATA COLLECTIONS

Preliminary Investigations of a Headwater Creek in Eastern Kentucky,
W76-11284 5G

BASELINE STUDIES

Field Studies on the Phytotoxicity of Crude Oil to Subarctic Aquatic Vegetation,
W76-11405 5C

Beneath the Tenn-Tom,
W76-11415 4A

Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area. Conference/Workshop Proceedings,
W76-11474 6G

The Department of the Interior's Outer Continental Shelf Leasing Program,
W76-11475 6G

Framework for Bureau of Land Management Programs,
W76-11476 6G

The Alaskan Outer Continental Shelf Environmental Assessment Program,
W76-11478 6G

Overview of Conference Programs,
W76-11481 6G

Biological Considerations,
W76-11484 6G

BASIC DATA COLLECTION

Ground-Water Records for Northeastern Oklahoma: Part 1--Records of Wells, Test-Holes, and Springs,
W76-11412 7C

BASIC DATA COLLECTIONS

Statistical Summaries of Indiana Streamflow Data,
W76-11409 7C

Hydrologic Records for Lake County, Florida, 1973-74,
W76-11414 7C

BASS

Food Habits of Yearling and Adult Striped Bass, Morone Saxatilis (Walbaum), from Albemarle Sound, North Carolina,
W76-11522 2I

BAYES THEOREM

Decision Theory and Its Application to Network Design,
W76-11498 7A

BAYFIELD (ONTARIO)

Groyne Stabilization of Slope Movements and Toe Erosion, Lake Huron Near Bayfield, Ontario,
W76-11290 8B

BAYS

The Crustacean Zooplankton of Green Bay, Lake Michigan,
W76-11278 2H

Modeling Chloride Distribution in Saginaw Bay,
W76-11312 5B

Bacterial Populations in Lower Green Bay,
W76-11428 2H

BDELLOVIBRIO-BACTERIOVORUS

Quantitative Characteristics of Distribution of Bdellovibrio Bacteriovorus in River Water, (In Russian),
W76-11551 5A

BELGIUM

Belgium (Legislation on Underground Waters).
W76-11120 6E

BELONE SP.

Cadmium Uptake by Marine Fish Larvae,
W76-11184 5C

BENEFITS

The Concept of Benefits in Cost-Benefit Analysis: With Emphasis on Water Pollution Control Activities,
W76-11154 5G

A Survey of the Techniques for Measuring the Benefits of Water Quality Improvement,
W76-11155 5G

The Redistributional Consequences of Public Recreation Provision at the Potholes Reservoir--Columbia Basin Project, Washington,
W76-11168 6B

BENTHIC FAUNA

Ecology of the Littoral Polychaete Streptosyllis Websteri, A New Species in the Baltic,
W76-11186 5B

Composition of the Oligochaete Fauna of Central Lake Michigan,
W76-11323 5C

A Comparative Study of the Effects on the Marine Environment of Wastes from Cellulose Industries in Scotland and Sweden,
W76-11402 5C

BENTHOS

The Effects of Variations in Turbidity on Cycles of Planktonic and Benthic Organisms in Flood Control Reservoirs,
W76-11172 5C

Ecology of the Littoral Polychaete Streptosyllis Websteri, A New Species in the Baltic,
W76-11186 5B

Analysis of Selected Benthic Communities in the Florida Everglades with Reference to their Physical and Chemical Environment,
W76-11418 5A

The Application of 'Biotic Indices' to the Study of Pollution in a River with Cyprinidae, (In French),
W76-11580 5A

Supershrimp: Deep Bioturbation in the Strait of Canso, Nova Scotia,
W76-11584 5C

Organic Pollution in Ensenada Bay, Mexico,
W76-11587 5B

PCB Levels in Clyde Marine Sediments and Fauna,
W76-11589 5B

BENZYL PENICILLIN

Experience in the Treatment of Highly-Concentrated Spent Native Solution of Benzyl Penicillin, (In Russian),
W76-11543 5F

BIG BEAR RIVER BASIN (MISS)

The Impact of Flooding Upon Land Values in the Big Black River Basin,
W76-11330 6

BIG SANDY RIVER (KY)

Flood Plain Information: Big Sandy River, Boyd County, Kentucky.
W76-11357 4

BIN ACTIVATORS

Bin Activators Reliably Feed Lime and Diatomaceous Earth in Water Treatment Facility.
W76-11208 5

BIOASSAY

Petroleum Compounds in the Marine Food Web: Short-Term Experiments on the Fate of Naphthalene in Calanus,
W76-11181 5

An Assessment of the Basis of Mercury Tolerance in Dunaliella Tertiolecta,
W76-11183 5C

Cadmium Uptake by Marine Fish Larvae,
W76-11184 5C

Herbicide Toxicity in Mangroves,
W76-11192 5C

Acute Toxicity of Certain Pesticides to Acartia Tonsa Dana,
W76-11193 5C

Studies on the Susceptibility of Ankistrodesmus Species to Crude Oil Components,
W76-11195 5C

On-Site Bioassay Testing at Cariboo Pulp and Paper,
W76-11394 5C

Ecotoxicology of Crude Oils and the Use of Experimental Marine Ecosystems,
W76-11586 5C

Reduction of Field Populations of Fiddler Crabs by Uptake of Chlorinated Hydrocarbons,
W76-11588 5C

Effects of Crude Oil and Dispersants on Bivalves,
W76-11591 5C

Toxicity of Oil-Sinking Agents,
W76-11592 5C

CHEMICAL OXYGEN DEMAND

The Extension of the Sewage-Treatment Plants of Stuttgart (Der Ausbau Der Stuttgarter Klarwerke).
W76-11210 5D

Integral Circular Wastewater Treatment Process,
W76-11222 5D

Research on the Mechanisms for Removal of Soluble BOD(5) in Clarifier Systems,
W76-11378 5D

Documentation for ES001. A Steady-State, One Dimensional, Estuarine Water Quality Model,
W76-11460 5B

Identification of Organic Compounds in Effluents from Industrial Sources,
W76-11598 5A

DEGRADATION

The Baltic Sea Pollution,
W76-11185 5C

ECOENOSES

Release of Strontium-90 Content in the Tundra Soil-Vegetation Cover, (In Russian),
W76-11565 2K

INDICATORS

The Baltic Sea Pollution,
W76-11185 5C

A Comparative Study of the Effects on the Marine Environment of Wastes from Cellulose Industries in Scotland and Sweden,
W76-11402 5C

The Application of 'Biotic Indices' to the Study of Pollution in a River with Cyprinidae, (In French),
W76-11580 5A

Absorption and Accumulation of Pesticides Residues and Chlorinated Biphenyls in Both Wild Aquatic Vegetation and Rice in the Camargue Region, (In French),
W76-11582 5C

BIOLOGICAL PROPERTIES

Biological Transformation of Clay-Sized Sediments in Simulated Aquatic Environments,
W76-11291 2J

BIOLOGICAL TREATMENT

The Extension of the Sewage-Treatment Plants of Stuttgart (Der Ausbau Der Stuttgarter Klarwerke).
W76-11210 5D

Method of Processing Refuse and/or Sludge and A Plant for Carrying out the Method,
W76-11218 5D

Biological Purification of Highly Concentrated Spent Sodium Sulfite Pulping Liquors (Etude de l'epuration biologique de lessives residuaires au sulfite de sodium de forte concentration),
W76-11364 5D

Process Wastewater: Reclamation or Disposal,
W76-11376 5D

Intensification of Biological Purification of Effluents (Intensifikatsiya biologicheskoi ochistki stokov),
W76-11391 5D

A Chemical-Biological Treatment Process for Cellulose Nitrate Disposal,
W76-11395 5D

BIOLOGY

Proceedings, Seventeenth Conference on Great Lakes Research, Part 1.
W76-11275 2H

Proceedings, Seventeenth Conference on Great Lakes Research, Part 2.
W76-11424 2H

BIOMASS

Long-Term Acidification of a Lake and Resulting Effects on Fishes,
W76-11178 5C

The Baltic Sea Pollution,
W76-11185 5C

Biometer Measurement of Activated Sludge at Westvaco Corporation,
W76-11375 5D

Oligotrophication - A Self-Accelerating Process In Lakes Subjected to Excessive Supply of Acid Substances,
W76-11403 5C

Phytoplankton Biomass, Species Composition and Primary Production at a Nearshore and a Midlake Station of Lake Ontario During IFYGL,
W76-11426 5C

The Problem of Mercury in the Mediterranean, (In French),
W76-11531 5B

Relation Between Generation Time and Biomass of Phytoplankton, (In Russian),
W76-11577 5C

BIOPOLYMERS

Study of Water Sorption on Biopolymers, (In Russian).
W76-11532 2K

BIOTA

Plutonium Distribution in Lake Michigan Biota,
W76-11287 2H

Oligotrophication - A Self-Accelerating Process In Lakes Subjected to Excessive Supply of Acid Substances,
W76-11403 5C

Texas Coastal Management Program. Hearing Draft. Appendices.
W76-11467 6B

BIOTIC BALANCE

Primary Production and Biotic Balance of Plankton in the Northeastern Part of the Amur Bay, (In Russian),
W76-11576 5C

BISULFITE

Effects of Bisulfite on Metabolic Development in Synchronous Chlorella Pyrenoidosa,
W76-11187 5C

BLACK LIQUORS

Determination of Lignin in Effluents (Opredelenie lignina v stochnykh vodakh),
W76-11387 5A

BLEACHING WASTES

The Effluent-Free Bleached Kraft Pulp Mill. Part VI. Substantial Substitution of Chlorine Dioxide for Chlorine in the First Stage of Bleaching,
W76-11382 3E

Handling and Disposal of Bleach Plant Effluents,
W76-11383 5D

Water Reuse and Recycle in the C(D)EHDED Bleach Sequence,
W76-11385 3E

BLUE GRAMA SEEDLING

Drought Resistance Characteristics of Blue Grama Seedlings,
W76-11505 2I

BOD5

Research on the Mechanisms for Removal of Soluble BOD(5) in Clarifier Systems,
W76-11378 5D

BOREHOLES

International Association of Drilling Contractors Drilling Manual,
W76-11102 8C

BORING

International Association of Drilling Contractors Drilling Manual,
W76-11102 8C

BORON

Microgram Determination of Boron in Surface Waters by Atomic Emission Spectrometry,
W76-11397 5A

BOTTOM TRANSPORT

Physical Oceanography Considerations,
W76-11483 6G

Biological Considerations,
W76-11484 6G

BOUNDARY LAYERS

The Determination of Regional Evapotranspiration by Means of Standard Meteorological Data,
W76-11110 2D

LIBRARY U. OF I. URBANA-CHAMPAIGN

BRAZIL (SALVADOR-BAHIA)
Bacterial and Coliform Counts in the Water Supply of Slaughter Houses Situated in the Vicinity of Salvador-Bahia: Brief Note, (In Portuguese),

Introduction,
W76-11469 6G

COASTS

Water Supply and Wastewater Disposal - Planning and Problems - In Coastal Areas,
W76-11225 5D

Ocean Outfall Disposal Systems,
W76-11226 5D

Shallow Subsurface Disposal of Wastewater,
W76-11228 5E

The Role of Conventional Wastewater Treatment in Coastal Areas,
W76-11229 5D

Summary: Technological Alternatives for Water Supply and Wastewater Disposal in the Coastal Area,
W76-11230 5E

Texas Coastal Management Program. Hearing Draft. Executive Summary.
W76-11465 6B

Fine Particles and Water Quality in the Coastal Marine Environment,
W76-11612 5B

Environmental Assessment of Marine Outfalls,
W76-11615 5E

Management and Financing Alternatives for Waste Disposal in Coastal Areas,
W76-11616 5E

Deep Well Disposal of Wastewater,
W76-11617 5E

Groundwater Supplies of the Coastal Region,
W76-11618 5F

Man Discovers the Coastal Environment: A Footprint in the Sand,
W76-11621 5D

First the Water, Then the Sewer, Then Land Use Planning: Coastal Planning in Retrospect and in the Now,
W76-11622 5E

Economic Implications of Coastal Waste Disposal Alternatives,
W76-11623 5E

COD

Uptake Pathways and Elimination of Nonionic Surfactant in Cod (Gadus Morrhua L.),
W76-11182 5

COFFEE (ARABICA)

Effects of Irrigation: Mulch and N-Fertilizer on Yield Components of Arabica Coffee Kenya,
W76-11456

COLIFORMS

A Forced Aeration System for Composting Wastewater Sludge,
W76-11200

Water Reuse Research,
W76-11272

States Role in Formulating Control Strategy,
W76-11408

Bacterial and Coliform Counts in the Water Supply of Slaughter Houses Situated in the Vicinity of Salvador-Bahia: Brief Note, (In Portuguese),
W76-11525

Antimicrobial-Resistant Coliforms in the York Bight,
W76-11590

COLORADO

Toxic Heavy Metals in Ground Water of a tion of the Front Range Mineral Belt,
W76-11105

Response of South Platte to Effluent Li tions,
W76-11137

Flood Plain Information: Cache La Po River, Colorado, Vol. III. Fort Collins-Gre Larimer-Weld County.
W76-11352

COLORIMETRY

Rapid Determination of NO3 in Wate Romanian),
W76-11559

COLUMBIA BASIN PROJECT (WASH)

The Redistributional Consequences of Recreation Provision at the Potholes Reser -Columbia Basin Project, Washington,
W76-11168

COLUMBIA RIVER

Food and Growth Parameters of Juvenile ook Salmon, Oncorhynchus Tshawytsc Central Columbia River,
W76-11411

IBINED SEWERS
la-HGMS Magnetic Filters for the Treatment Combined Sewer Overflow,
76-11265 5D

IBINED TREATMENT
e Effectiveness of Granular Activated Carn in Treating Municipal and Industrial stewaters,
76-11264 5D

MERCIAL FISH
mperature Effects of Young Yellow Perch, rca Flavescens (Mitchill),
76-11194 5C

MUNITY DEVELOPMENT
tematic Development of Methodologies in nning Urban Water Resources for Medium e Communities: Population Characteristics Residential Water Use,
6-11177 6B

PETING USES
ablishing Instream Flows: Analysis of the icy-Making Process in the Pacific thwest,
6-11339 6B

PREHENSIVE PLANNING
ject-by-Project Analysis VS. Comprehen- Planning,
6-11163 5G

tiple Objective Planning for Water ources, (Vol I),
6-11173 6B

tiple Objective Planning for Water ources, (Volume II),
6-11174 6B

PUTER MODELS
onse of South Platte to Effluent Limita-,
-11137 5B

PUTER PROGRAMS
ards a Computer-Based Information Monig System for Groundwater Data in New and,
-11247 4B

opolitan Toronto's Approach to Preventa- Maintenance for Treatment Plants,
-11255 5F

puter Program for Three-Dimensional ings from Irregular Finite Element Grid,
-11327 2F

mentation for ES001. A Steady-State, One nsional, Estuarine Water Quality Model,
11460 5B

le Tracking Data Management System,
11611 7C

RETE ADDITIVES
Paper Mill Sludge as Concrete Admix-
11399 5E

RENCES
ple Objective Planning for Water rces, (Vol I),
11173 6B

ple Objective Planning for Water rces, (Volume II),
11174 6B

Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area. Conference/Workshop Proceedings,
W76-11474 6G

Proceedings Tenth Biennial Conference on Ground Water, Total Water Management for California's Long-Range Needs.
W76-11491 4B

CONFINEMENT PENS
Hygienic Problems of Large Animal Confinement,
W76-11571 5G

CONIFEROUS FORESTS
The Tilted Forest: Glaciological-Geologic Implications of Vegetated Neoglacial Ice at Lituya Bay, Alaska,
W76-11423 2C

CONIFERS
Snowmelt Runoff from Planted Conifers in Southwestern Wisconsin,
W76-11369 4A

CONJUNCTIVE USE
Proceedings Tenth Biennial Conference on Ground Water, Total Water Management for California's Long-Range Needs.
W76-11491 4B

CONSERVATION
Valuing Long-Run Ecological Consequences and Irreversibilities,
W76-11161 6G

CONSTRAINTS
Management of Water Resources Under Different Socio-Economic Conditions,
W76-11514 6B

CONSUMPTIVE USE
Legal Institutions for the Allocation of Water and Their Impact on Coal Conversion Operations in Kentucky,
W76-11489 6E

CONTINENTAL SHELF
The Microbial Degradation of Oil in the Sea,
W76-11101 5B

Proceedings of the Symposium on Offshore Oil Potential and Related Land use Impacts in the Central California Coastal Zone.
W76-11461 6G

Random Model of Evaporation of Oil at Sea,
W76-11462 5B

The Alert Bay Oil Spill: A One-Year Study of the Recovery of a Contaminated Bay,
W76-11463 5C

Modeling the Fates of Metals in Ocean-Discharged Wastewaters,
W76-11464 5B

Texas Coastal Management Program. Hearing Draft. Executive Summary.
W76-11465 6B

Texas Coastal Management Program. Hearing Draft.
W76-11466 6B

Texas Coastal Management Program. Hearing Draft. Appendices.

Florida Coastal Policy Study: The Impact of Offshore Oil Development,
W76-11468 6G

Introduction,
W76-11469 6G

Review of Offshore Exploration in Florida,
W76-11470 6G

Environmental Impacts of OCS Oil and Gas Activity,
W76-11471 6G

Environmental Impacts and Monitoring of Oil and Gas Pipelines: A Technical Note,
W76-11472 6G

Deepwater Ports: Policy Issues in Florida,
W76-11473 6G

Bureau of Land Management's Environmental Studies Program for the South Atlantic Outer Continental Shelf Area. Conference/Workshop Proceedings,
W76-11474 6G

The Department of the Interior's Outer Continental Shelf Leasing Program,
W76-11475 6G

Southeast Coastal Research Activities of ERDA,
W76-11477 6G

The Alaskan Outer Continental Shelf Environmental Assessment Program,
W76-11478 6G

Environmental Protection Agency's Role, Interests, and Responsibilities with Respect to the Outer Continental Shelf Development,
W76-11479 6G

Offshore Operations, Regulation and Environmental Protection,
W76-11480 6G

Overview of Conference Programs,
W76-11481 6G

Geological Oceanography Considerations,
W76-11482 6G

Physical Oceanography Considerations,
W76-11483 6G

Biological Considerations,
W76-11484 6G

Conclusion and Recommendations Conference/Workshop,
W76-11485 6G

CONTROL
Interactions Between Land Use and Urban Water Resources Planning,
W76-11130 4A

COOLING WATER
The Effect of a Fossil Fuel Power Plant's Cooling Water System on the Water Quality of Green Bay, Wisconsin,
W76-11319 5B

COPEPODS
Acute Toxicity of Certain Pesticides to Acartia Tonsa Dana,
W76-11193 5C

COPPER
An Investigation of Three Methods for the Determination of Sub-micromolar ion Concentrations in Water,
W76-11331 5A

LIBRARY U. OF I. URBANA-CHAMPAIGN

COPPER IONS

COPPER IONS
An Investigation of Three Methods for the Determination of Sub-micromolar ion Concentrations in Water,
W76-11331 5A

COPPER SULFATE
Effect of Copper Sulfate on Mucus Cells in Young Trout (Salmo Irideus), (In French).
W76-11545 5C

COREXIT 7664
Effects of Crude Oil and Dispersants on Bi-Valves,
W76-11591 5C

CORN (FIELD)
Corn Plant Water Stress as Influenced by Chiseling, Irrigation, and Water Table Depth,
W76-11503 3F

Nitrogen Flux into Corn Roots as Influenced by Shoot Requirement,
W76-11519 3F

Studies on the Improvement Effect of Waste Liquor from Pulp Mills for the Soils: I. The Vegetation Experiments with Soybeans and Corn, (In Japanese),
W76-11563 5E

CORRELATION ANALYSIS
A Study of the Quality of Silk Reeling Water in Regard to Solubility of Cocoon-Sericin, (In Japanese),
W76-11557 5B

COST ANALYSIS
The Treatment of Water Purification Plant Wastes,
W76-11256 5F

Wastewater Recycle - The Proper Approach to Evaluation of Disposal Versus Reuse,
W76-11263 5D

Economic Implications of Coastal Waste Disposal Alternatives,
W76-11623 5E

COST-BENEFIT ANALYSIS
Cost Benefit Analysis and Water Pollution Policy.
W76-11153 5G

The Concept of Benefits in Cost-Benefit Analysis: With Emphasis on Water Pollution Control Activities,
W76-11154 5G

A Survey of the Techniques for Measuring the Benefits of Water Quality Improvement,
W76-11155 5G

Some Institutional and Conceptual Thoughts on the Measurement of Indirect and Intangible Benefits and Costs,
W76-11156 6B

A Survey of Empirical Benefit Studies,
W76-11157 6B

Costs of Water Quality Improvement, Transfer Functions, and Public Policy,
W76-11158 5G

Environmental Policy Costs: Definition, Measurement, and Conjecture,
W76-11159 5G

Estimates of Industrial Waterborne Residuals Control Costs: A Review of Concepts, Methodology, and Empirical Results,
W76-11160 5G

Valuing Long-Run Ecological Consequences and Irreversibilities,
W76-11161 6G

Cost-Benefit Analysis, Property Right Specification and 'Distribution',
W76-11162 6B

Project-by-Project Analysis VS. Comprehensive Planning,
W76-11163 5G

Cost-Benefit Analyses of Cost-Benefit Analysis,
W76-11164 6B

The Role of Cost-Benefit Analysis in Policy Making,
W76-11165 6B

Voting, Cost-Benefit Analysis, and Water Pollution Policy,
W76-11166 5G

Wichita Falls Integrated Municipal Information System, Water Utility Processing System (WUPS), Application Completion Report, Volume I.
W76-11596 3D

Wichita Falls Integrated Municipal Information System, Water Utility Processing System (WUPS), Application Completion Report, Volume II.
W76-11597 3D

COST COMPARISONS
Wastewater Recycle - The Proper Approach to Evaluation of Disposal Versus Reuse,
W76-11263 5D

COST EFFECTIVENESS
Hydraulic Collection and Disposal of Refuse,
W76-11138 5D

Multi-Criterion Ranking of Alternative Long-Range Water Resource Systems,
W76-11139 6B

COST MINIMIZATION
Estimated Costs of Mechanical Control of Water Hyacinths,
W76-11141 5G

A Stochastic Programming Model Applied to Water Resources Management,
W76-11144 4A

Cost Optimization of Rural Water Systems,
W76-11167 6C

COST SHARING
Cost Sharing to Induce Efficient Techniques of Abating Wastewater Pollution,
W76-11135 5G

COSTS
Optimization of Water Distribution Network Systems,
W76-11133 8B

Costs of Water Quality Improvement, Transfer Functions, and Public Policy,
W76-11158 5G

Environmental Policy Costs: Definition, Measurement, and Conjecture,
W76-11159 5G

Estimates of Industrial Waterborne Residuals Control Costs: A Review of Concepts, Methodology, and Empirical Results,
W76-11160 5G

Cost Optimization of Rural Water Systems,
W76-11167 6C

CRABS
Reduction of Field Populations of Fiddle Crabs by Uptake of Chlorinated Hydrocarbon
W76-11588 5

CROP PRODUCTION
A Quadratic Programming Approach to U Production of California Field and Vegetab Crops Emphasizing Land, Water and Ener Use,
W76-11326

Effects of Irrigation: Mulch and N-Fertiliz on Yield Components of Arabica Coffee Kenya,
W76-11456

Corn Plant Water Stress as Influenced Chiseling, Irrigation, and Water Table Depth
W76-11503

Management of Water Resources Under I ferent Socio-Economic Conditions,
W76-11514

CROP RESPONSE
Effects of Irrigation Regimes, Planting Da Nitrogen Levels, and Row Spacing on flower Cultivars,
W76-11515

Fertilizing Dryland Grain Sorghum on Up Soils the 20- to 26- Inch Rainfall Area in sas,
W76-11516

CROSSDATING
Riparian Dendrochronology: A Method Determining Flood Histories of Ung Watersheds,
W76-11523

CRUDE OIL
Ecotoxicology of Crude Oils and the U Experimental Marine Ecosystems,
W76-11586

Effects of Crude Oil and Dispersants o Valves,
W76-11591

CRUSTACEAN
Supershrimp: Deep Bioturbation in the St Canso, Nova Scotia,
W76-11584

CRUSTACEANS
Crustacean Zooplankton of Southwestern Ontario in 1972 During the Internationa Year for the Great Lakes,
W76-11276

The Crustacean Zooplankton of Green Lake Michigan,
W76-11278

CRYSTALLIZATION
The Availability of Desalting for Water from Saline Sources,
W76-11619

CULTIVATION
Effect of Tillage Systems on Runoff Le Pesticides: A Simulated Rainfall Study,
W76-11169

RRENTS (WATER)
Nearshore Currents and Water Temperatures Along the North Shore of Lake Ontario Between Pickering and Cobourg,
W76-11302 2H

Water Current Force Measuring Apparatus,
W76-11444 7B

YAHOGA RIVER (OHIO)
Numerical Model for Thermal Plumes and River Discharges,
W76-11310 5B

CLING NUTRIENTS
hosphorus Cycling and Luxury Phosphorus orage by Algae in the Waters of Green Bay,
76-11332 5C

PRINIDAE
he Application of 'Biotic Indices' to the Study Pollution in a River with Cyprinidae, (In ench),
76-11580 5A

OLOGICAL STUDIES
Assessment of the Basis of Mercury lerance in Dunaliella Tertiolecta,
76-11183 5C

lation Between Generation Time and omass of Phytoplankton, (In Russian),
76-11577 5C

CHOSLOVAKIA

LIBRARY U. OF I. URBANA-CHAMPAIGN

FLOOD PROFILES
Flood Plain Information: Kaskaskia River, Bear Creek, Lake Fork Creek, West Fork Creek and 'A' Creek, Douglas County, Illinois, No. 1.
W76-11341 4A

Flood Plain Information: Lake Monroe, Near Sanford, Florida.
W76-11342 4A

Flood Plain Information: Northeast Volusia County, Florida.
W76-11343 4A

Flood Plain Information: Swift Creek, Macon and Bibb County, Georgia.
W76-11344 4A

Flood Plain Information: Waycross Drainage Canal, Waycross and Ware County, Georgia.
W76-11345 4A

Flood Plain Information: Kenai River, Phase II, Kenai Peninsula Borough, Alaska,
W76-11347 4A

Flood Plain Information: Fisher Creek, Santa Clara County, California,
W76-11348 4A

Flood Plain Information: Deer Creek and White River, Earlimart, California,
W76-11350 4A

Flood Plain Information: Green Valley, Dan Wilson, and Suisun Creeks, Cordelia, California.
W76-11351 4A

Flood Plain Information: Wabash River, Miami County and Peru, Indiana.
W76-11353 4A

Flood Plain Information: Pogues Run, Pleasant Run, and Bean Creek, Marion County, Indiana.
W76-11354 4A

Flood Plain Information: Lick Creek and Little Buck Creek, Marion County, Indiana.
W76-11355 4A

Flood Plain Information: Little Arkansas River and Sand Creek, Sedgwick, Kansas.
W76-11356 4A

Flood Plain Information: Big Sandy River, Boyd County, Kentucky.
W76-11357 4A

Flood Plain Information: Merrimack River, City of Concord, New Hampshire.
W76-11359 4A

Flood Plain Information: Alum Creek, Vicinity of Columbus, Ohio.
W76-11360 4A

Flood Plain Information: South Fork Rivanna River, Albemarle County, Virginia.
W76-11361 4A

FLOOD PROTECTION
Flood Plain Information: Buck Creek and Grassy Creek, Marion County, Indiana,
W76-11346 4A

Flood Plain Information: Green Valley, Dan Wilson, and Suisun Creeks, Cordelia, California.
W76-11351 4A

Flood Plain Information: Cache La Poudre River, Colorado, Vol. III. Fort Collins-Greeley-Larimer-Weld County
W76-11352 4A

Flood Plain Information: Pogues Run, Pleasant Run, and Bean Creek, Marion County, Indiana.
W76-11354 4A

Flood Plain Information: Lick Creek and Little Buck Creek, Marion County, Indiana.
W76-11355 4A

Flood Plain Information: Little Arkansas River and Sand Creek, Sedgwick, Kansas
W76-11356 4A

Flood Plain Information Quinebaug River - Cady Brook, Town of Southbridge, Massachusetts.
W76-11358 4A

Flood Plain Information: Merrimack River, City of Concord, New Hampshire.
W76-11359 4A

FLOOD STAGES
Flood Plain Information: Kaskaskia River, Bear Creek, Lake Fork Creek, West Fork Creek and 'A' Creek, Douglas County, Illinois, No. 1.
W76-11341 4A

Flood Plain Information: Swift Creek, Macon and Bibb County, Georgia.
W76-11344 4A

Flood Plain Information: Alamitos Creek, Including Guadalupe Creek-Arroyo Calero and Santa Teresa Creek, Santa Clara County, California,
W76-11349 4A

Flood Plain Information: Deer Creek and White River, Earlimart, California,
W76-11350 4A

Flood Plain Information: Little Arkansas River and Sand Creek, Sedgwick, Kansas.
W76-11356 4A

Flood Plain Information: Quinebaug River - Cady Brook, Town of Southbridge, Massachusetts.
W76-11358 4A

FLOODS
Flood Plain Information: Kaskaskia River, Bear Creek, Lake Fork Creek, West Fork Creek and 'A' Creek, Douglas County, Illinois, No. 1.
W76-11341 4A

Flood Plain Information: Lake Monroe, Near Sanford, Florida.
W76-11342 4A

Flood Plain Information: Northeast Volusia County, Florida.
W76-11343 4A

Flood Plain Information: Swift Creek, Macon and Bibb County, Georgia.
W76-11344 4A

Flood Plain Information: Fisher Creek, Santa Clara County, California,
W76-11348 4A

Flood Plain Information: Green Valley, Dan Wilson, and Suisun Creeks, Cordelia, California.
W76-11351 4A

Flood Plain Information Cache La Poudre River, Colorado, Vol III Fort Collins-Greeley-Larimer-Weld County
W76-11352 4A

FLOODWALLS
Flood Plain Information Big Sandy River, Boyd County, Kentucky
W76-11357 4A

FLORIDA
Herbicide Toxicity in Mangroves,
W76-11192 5C

Flood Plain Information Lake Monroe, Near Sanford, Florida.
W76-11342 4A

Flood Plain Information Northeast Volusia County, Florida
W76-11343 4A

Hydrologic Records for Lake County, Florida, 1973-74,
W76-11414 7C

Analysis of Selected Benthic Communities in the Florida Everglades with Reference to the Physical and Chemical Environment,
W76-11418 5

Florida Coastal Policy Study: The Impact Offshore Oil Development,
W76-11468 6

Introduction,
W76-11469

Review of Offshore Exploration in Florida,
W76-11470

Environmental Impacts of OCS Oil and G Activity,
W76-11471

Environmental Impacts and Monitoring of and Gas Pipelines: A Technical Note,
W76-11472

Deepwater Ports: Policy Issues in Florida,
W76-11473

Petrographic and Geohydrologic Model Aquifer Limestones in Florida,
W76-11493

Environmental Assessment of Marine Outfa
W76-11615

FLOTATION
Board Mill Wastewater Treatment System Countercurrent Dissolved Air Flot Thickening and Vacuum Filter Dewatering
W76-11380

FLOUNDER
Cadmium Uptake by Marine Fish Larvae,
W76-11184

FLOW
Design of Pollutant Oriented Integrated toring Systems,
W76-11238

FLOW CHARACTERISTICS
Flood Plain Information: Kaskaskia Bear Creek, Lake Fork Creek, West Creek and 'A' Creek, Douglas County, I No. 1.
W76-11341

Information Transfer for Stream Dischar
W76-11499

W DURATION
lood Plain Information: Lake Monroe, Near nford, Florida.
76-11342 4A

ood Plain Information: Merrimack River, ty of Concord, New Hampshire.
76-11359 4A

ORESCENCE
uorescence Measurements of Carcinogenic d Polycyclic Aromatic Hydrocarbons in ater,
76-11243 5A

ORIDATION
tomated Fluoridation Using a Selective Ion ctrode,
76-11251 5F

ORIDES
tomated Fluoridation Using a Selective Ion ctrode,
76-11251 5F

oride in Marine Animals,
6-11593 5C

ASH
Ash - A Potential Asset in Wastewater atment,
6-11274 5D

D CHAINS
roleum Compounds in the Marine Food b: Short-Term Experiments on the Fate of phthalene in Calanus,
6-11181 5C

Integrated Study on the Impact of Metallic ce Element Pollution in the Coeur D'Alene-kane Rivers-Lake Drainage System,
6-11488 5C

oride in Marine Animals,
6-11593 5C

PROCESSING INDUSTRY
anic Pollution in Ensenada Bay, Mexico,
-11587 5B

WEBS
oleum Compounds in the Marine Food : Short-Term Experiments on the Fate of hthalene in Calanus,
-11181 5C

CASTING
ginal Pollution Analysis for Long Rage casts,
-11127 5G

mulation Model for Long-Term Forecast-f Waste Loadings from Population, Land and Economic Activities in the Great s Basin,
11320 5B

l Analysis and Diagnosis over Lake On-and Vicinity,
11432 2H

Lakes Wind Forecasts Based on Model it Statistics,
11434 2H

GN COUNTRIES
m (Legislation on Underground Waters).
11120 6E

nd and Wales, (Legislation on Un-ound Waters).
11121 6E

France, (Legislation on Underground Waters).

FOREST SOILS
Evolution of the Cations Involved in Rain, Canopy Leachate and Drainage Water through a Forest Ecosystem, (In French),
W76-11540 2G

FOREST WATERSHED
Water Quality of Streamflow from Ponderosa Pine Forest Watersheds on Sedimentary Soils,
W76-11490 5A

FOREST WATERSHEDS
Snowmelt Runoff from Planted Conifers in Southwestern Wisconsin,
W76-11369 4A

FOREST WATESHEDS
Effect of Plantation Establishment on Soil and Soil Water in Southwestern Wisconsin,
W76-11365 4D

FORESTS
The Impact of Vacation Homes on National Forest Water Resources,
W76-11366 5G

FOSSIL FUELS
The Microbial Degradation of Oil in the Sea,
W76-11101 5B

The Alert Bay Oil Spill: A One-Year Study of the Recovery of a Contaminated Bay,
W76-11463 5C

FOUNTAIN VALLEY (CALIF)
Annual Report - VTE/MSF Module - Fountain Valley Test Facility, July 1, 1975 - April 30, 1976.
W76-11325 3A

FOX RIVER (WIS)
Water Quality Model of the Lower Fox River, Wisconsin,
W76-11316 5B

The Effect of a Fossil Fuel Power Plant's Cooling Water System on the Water Quality of Green Bay, Wisconsin,
W76-11319 5B

Bacterial Populations in Lower Green Bay,
W76-11428 2H

FRAGIPAN HORIZON
Fragipan Stability in Soil-Plant Effluent Disposal Systems,
W76-11104 2G

FRANCE
France, (Legislation on Underground Waters).
W76-11122 6E

FRANCE (LAKE NANTUA)
Physico-Chemical Parameters of the Hydrographic System of Lake Nantua: Relation with Oscillatoria, (In French),
W76-11575 5C

FRANCE (MORLAIX BAY)
The Distribution of Nutrient Salts in the Morlaix Bay (Finistere, France): The Role of Benthic Algae, (In French),
W76-11583 5B

FRANCE (RHONE DELTA)
Absorption and Accumulation of Pesticides Residues and Chlorinated Biphenyls in Both Wild Aquatic Vegetation and Rice in the Camargue Region, (In French),
W76-11582 5C

FRANCE (VEZERE RIVER)
The Application of 'Biotic Indices' to the Study of Pollution in a River with Cyprinidae, (In French),
W76-11580 5A

FRASER RIVER (BRITISH COLUMBIA)
Toxicity: Research and Regulation.
W76-11374 5C

FREEZING
A New Concept in Small Water Systems.
W76-11253 5D

FRESHWATER FISH
Temperature Effects of Young Yellow Perch, Perca Flavescens (Mitchill),
W76-11194 5C

FUNDULUS HETEROCLITUS
Thermal Tolerance of Stored Fundulus Heteroclitus Gametes: Fertilizability and Survival of Embryos,
W76-11180 5C

FUNGI
A Preliminary Study on the Occurrence and Distribution of Geofungi in Lake Ontario Near the Niagara River,
W76-11427 2H

Carissa Dieback: Etiology Suggests Control.
W76-11513 2I

FUNGICIDES
Carissa Dieback: Etiology Suggests Control.
W76-11513 2I

GABIONS
Groyne Stabilization of Slope Movements and Toe Erosion, Lake Huron Near Bayfield, Ontario,
W76-11290 8B

GAGING STATIONS
Statistical Summaries of Indiana Streamflow Data,
W76-11409 7C

Information Transfer for Stream Discharge,
W76-11499 7A

GAMETOCIDES
Thermal Tolerance of Stored Fundulus Heteroclitus Gametes: Fertilizability and Survival of Embryos,
W76-11180 5C

GAS CHROMATOGRAPHY
The Determination of Phenols in Water: Gas Chromatographic Identification by Means of the Electron Affinity, (In German),
W76-11552 5A

GAS INDUSTRY
Overview of Conference Programs,
W76-11481 6G

LIBRARY U. OF I. URBANA-CHAMPAIGN

GEOFUNGI
A Preliminary Study on the Occurrence and Distribution of Geofungi in Lake Ontario Near the Niagara River,
W76-11427 2H

GEOLOGICAL SURVEYS
Geophysical Prospecting for Ground Water in Alaska,
W76-11496 4B

GEOLOGY
Geological Oceanography Considerations,
W76-11482 6G

GEORGE LAKE (CANADA)
Long-Term Acidification of a Lake and Resulting Effects on Fishes,
W76-11178 5C

GEORGIA
Flood Plain Information: Swift Creek, Macon and Bibb County, Georgia.
W76-11344 4A

Flood Plain Information: Waycross Drainage Canal, Waycross and Ware County, Georgia.
W76-11345 4A

Extended Aeration in a Combined Wastewater Treatment Plant,
W76-11373 5D

GEOTHERMAL STUDIES
Some Issues Regarding Regulatory Policy, Political Participation, and Social Implications of Geothermal Resource Development in the Imperial Valley,
W76-11328 6E

GLACIAL AQUIFERS
Systematic Development of Methodologies in Planning Urban Water Resources for Medium Size Communities: Regional Aquifer Evaluation Studies with Stochastic Inputs,
W76-11176 6B

GLACIERS
The Tilted Forest: Glaciological-Geologic Implications of Vegetated Neoglacial Ice at Lituya Bay, Alaska,
W76-11423 2C

GLACIOLOGY
The Tilted Forest: Glaciological-Geologic Implications of Vegetated Neoglacial Ice at Lituya Bay, Alaska,
W76-11423 2C

GOLDEYE
Vertical Distribution Patterns of Goldeye, Hiodon Alosoides, in Fort Peck Reservoir, Montana,
W76-11333 2H

GOLDFISH
The Toxicity of the Herbicide Dichlobenil to Goldfish (Carassius Auratus),
W76-11188 5C

GRAIN SORGHUM
Fertilizing Dryland Grain Sorghum on Upland Soils the 20- to 26- Inch Rainfall Area in Kansas,
W76-11516 3F

GRAMA GRASSES
Drought Resistance Characteristics of Blue Grama Seedlings,
W76-11505 2I

GRANULES
Granular Media Filtration: A Positive Cost Effective Method to Prepare Wastewaters for Reuse by Removal of Suspended Solids,
W76-11262 5D

The Effectiveness of Granular Activated Carbon in Treating Municipal and Industrial Wastewaters,
W76-11264 5D

GRAPHICAL ANALYSIS
The Volumetric Properties of H20--A Graphical Portrayal,
W76-11420 1A

GRASSES
New Techniques in Vegetation Maintenance on Military Reservations,
W76-11149 5G

Texas Coastal Management Program. Hearing Draft. Appendices.
W76-11467 6B

GREAT LAKES
Proceedings, Seventeenth Conference on Great Lakes Research, Part 1.
W76-11275 2H

Crustacean Zooplankton of Southwestern Lake Ontario in 1972 During the International Field Year for the Great Lakes,
W76-11276 2H

Vertical Interactions in Phytoplankton Populations - An Asymptotic Eigenvalue Analysis,
W76-11277 2H

The Crustacean Zooplankton of Green Bay, Lake Michigan,
W76-11278 2H

Temporal and Spatial Distributions of Planktonic Rotifers in Milwaukee Harbor and Adjacent Lake Michigan,
W76-11285 2H

Modeling of Phytoplankton in Lake Ontario,
W76-11286 5C

Occurrence of As, Cd, Co, Cr, Cu, Fe, Hg, Ni, Sb, and Zn in Lake Erie Sediments,
W76-11293 5B

IFYGL Weather Highlights,
W76-11299 2B

Great Lakes Temperature Maps by Satellite,
W76-11300 2H

Selected Satellite Data on Snow and Ice in the Great Lakes Basin 1972-73,
W76-11301 2C

Nearshore Currents and Water Temperatures Along the North Shore of Lake Ontario Between Pickering and Cobourg,
W76-11302 2H

Assessment of the Effects of Waste Heat Inputs on Water Budgets of the Great Lakes,
W76-11305 5C

Helmholtz Resonance in Harbours of the Great Lakes,
W76-11306 2H

A Simulation Model for Long-Term Forecasting of Waste Loadings from Population, Land Use, and Economic Activities in the Great Lakes Basin,
W76-11320 5B

Sources of Water Quality, Lake Level, Ice, Water Temperature, and Meteorological Data for the St. Lawrence Great Lakes,
W76-11363 7C

Proceedings, Seventeenth Conference on Great Lakes Research, Part 2.
W76-11424 2H

IFYGL Chemical Intercomparisons,
W76-11430 2H

Great Lakes Wind Forecasts Based on Model Output Statistics,
W76-11434 2I

Optical Properties of the Great Lakes,
W76-11440 2I

Particulate Residence Times,
W76-11450 5

GREAT SALT LAKE
A Survey of the Physical Limnology of Great Salt Lake,
W76-11107 2

GREAT SIPPEWISSETT MARSH (MASS)
Reduction of Field Populations of Fiddl Crabs by Uptake of Chlorinated Hydrocarbo
W76-11588

GREEN BAY (WIS)
The Crustacean Zooplankton of Green B Lake Michigan,
W76-11278

The Effect of a Fossil Fuel Power Plant's Co ing Water System on the Water Quality Green Bay, Wisconsin,
W76-11319

Phosphorus Cycling and Luxury Phospho Storage by Algae in the Waters of Green Ba
W76-11332

Bacterial Populations in Lower Green Bay,
W76-11428

GRENADA RESERVOIR (MISS)
The Effects of Variations in Turbidity on cles of Planktonic and Benthic Organism Flood Control Reservoirs,
W76-11172

GROINS (STRUCTURES)
Groyne Stabilization of Slope Movement Toe Erosion, Lake Huron Near Bayfield tario,
W76-11290

GROUND WATER
Systematic Development of Methodolog Planning Urban Water Resources for M Size Communities. Phase I. Final Report,
W76-11175

GROUNDWATER
Toxic Heavy Metals in Ground Water of tion of the Front Range Mineral Belt,
W76-11105

Towards a Computer-Based Information toring System for Groundwater Data i Zealand,
W76-11247

Effect of Plantation Establishment on S Soil Water in Southwestern Wisconsin,
W76-11365

Ground-Water Records for Northeastern Oklahoma: Part 1--Records of Wells, Test-Holes, and Springs,
W76-11412 7C

Hydrologic Records for Lake County, Florida, 1973-74,
W76-11414 7C

Ground-Water Flow and Pollution at a Well Field, Olean, New York,
W76-11417 5B

Proceedings Tenth Biennial Conference on Ground Water, Total Water Management for California's Long-Range Needs.
W76-11491 4B

Modeling Solute Transport in Ground Water,
W76-11605 5B

GROUNDWATER AVAILABILITY
Impact of Water Supply and Wastewater on the Coastal and Marine Environments,
W76-11625 5D

GROUNDWATER BASIN INVENTORY
Underground Storage of State Water Project Supply, A Progress Report,
W76-11119 4B

GROUNDWATER BASINS
Underground Storage of State Water Project Supply, A Progress Report,
W76-11119 4B

GROUNDWATER MOVEMENT
Ground-Water Flow and Pollution at a Well Field, Olean, New York,
W76-11417 5B

GROUNDWATER MOVEMENTS
Orographic and Geohydrologic Model of Aquifer Limestones in Florida,
W76-11493 2F

GROUNDWATER RECHARGE
Systematic Development of Methodologies in Planning Urban Water Resources for Medium Size Communities: Regional Aquifer Evaluation Studies with Stochastic Inputs,
W76-11176 6B

GROUNDWATER RESOURCES
Ground-Water Resources and Water Use in Northern Navajo County, Arizona,
W76-11410 2F

Geophysical Prospecting for Ground Water in Alaska,
W76-11496 4B

Groundwater Supplies of the Coastal Region,
W76-11618 5F

GROWTH RATES
Systematic Development of Methodologies in Planning Urban Water Resources for Medium Size Communities: Population Characteristics and Residential Water Use,
W76-11177 6B

Assessment of the Basis of Mercury Tolerance in Dunaliella Tertiolecta,
W76-11183 5C

Effects of Bisulfite on Metabolic Development of Synchronous Chlorella Pyrenoidosa,
W76-11187 5C

Studies on the Susceptibility of Ankistrodesmus Species to Crude Oil Components,
W76-11195 5C

The Effects of Aqueous Extracts of Crude Oil and Naphthalene on the Physiology and Morphology of a Freshwater Green Alga,
W76-11404 5C

The Effects of NTA on the Growth of Phytoplankton with Particular Consideration Given to Iron as a Microelement,
W76-11578 5C

Effect of Treated Sewage Effluents on Phytoplankton in Lakes, (In German),
W76-11579 5C

Fish Culture in Warmed Waters in the Czechoslovak Socialist Republic (Chov Ryb V Oteplenych Vodach V Ceskoslovenske Socialisticke Republice),
W76-11595 5C

GULF STREAM
Biological Considerations,
W76-11484 6G

GUPPY
The Patterns of 14C Accumulation and Removal in Freshwater Fishes, (In Russian),
W76-11561 5C

HABITAT IMPROVEMENT
Supershrimp: Deep Bioturbation in the Strait of Canso, Nova Scotia,
W76-11584 5C

HALOPHYTES
Midsummer Metabolism of an Eelgrass Community,
W76-11594 5C

HARBORS
Helmholtz Resonance in Harbours of the Great Lakes,
W76-11306 2H

HARVESTING
Estimated Costs of Mechanical Control of Water Hyacinths,
W76-11141 5G

HAWAII
Collected Reprints, Volume III: 1971-1974,
W76-11103 6B

HAZEN-WILLIAMS EQUATION
Optimization of Water Distribution Network Systems,
W76-11133 8B

HEAT BUDGET
The Atmospheric Budgets Program of IFYGL,
W76-11436 2H

HEAT TRANSFER
Reclamation of Gas Turbine Waste Heat for Sludge Drying,
W76-11268 5D

Annual Report - VTE/MSF Module - Fountain Valley Test Facility, July 1, 1975 - April 30, 1976.
W76-11325 3A

HEATED WATER
Assessment of the Effects of Waste Heat Inputs on Water Budgets of the Great Lakes,
W76-11305 5C

HEATED WATERS
Fish Culture in Warmed Waters in the Czechoslovak Socialist Republic (Chov Ryb V Oteplenych Vodach V Ceskoslovenske Socialisticke Republice),
W76-11595 5C

HEAVY METALS
Toxic Heavy Metals in Ground Water of a Portion of the Front Range Mineral Belt,
W76-11105 5B

Sewer Waste Water Treating Agent Produced from Waste Cracking Catalyst,
W76-11219 5D

Occurrence of As, Cd, Co, Cr, Cu, Fe, Hg, Ni, Sb, and Zn in Lake Erie Sediments,

LIBRARY U. OF I. URBANA-CHAMPAIGN

HISTORIC FLOODS

Flood Plain Information: Wabash River, Miami County and Peru, Indiana.
W76-11353 4A

HORSETAILS
Field Studies on the Phytotoxicity of Crude Oil to Subarctic Aquatic Vegetation,
W76-11405 5C

HOSPITALS
Wastewater Reuse Within an Army Field Hospital,
W76-11269 5D

Treatment of Army M U S T Field Hospital Wastewater for Water Reuse,
W76-11270 5D

HUMAN DISEASES
Hygienic Problems of Large Animal Confinement,
W76-11571 5G

HUMATES
Wettability of Humic Acid and its Salts,
W76-11421 2K

HUMIC ACID
Wettability of Humic Acid and its Salts,
W76-11421 2K

HUMIDITY
Generalized Profiles of Wind Speed, Temperature and Humidity,
W76-11304 2H

HUMUS
Study of the Behaviour of Poliomyelitis Virus Type 1 in Different Hydrous Media, (In French),
W76-11569 5A

A Comparison of the Abundance and Diversity of Fossil Pigments in Wetland Peats and Woodland Humus Layers,
W76-11601 5C

HUNGARY
A Stochastic Programming Model Applied to Water Resources Management,
W76-11144 4A

HURRICANE AGNES
Duration-Limited Wave Spectra in Lake Ontario During the 1972 Hurricane Agnes,
W76-11309 2H

HURRICANES
Duration-Limited Wave Spectra in Lake Ontario During the 1972 Hurricane Agnes,
W76-11309 2H

Flood Plain Information: Northeast Volusia County, Florida.
W76-11343 4A

HYDRAULIC CONDUCTIVITY
Fragipan Stability in Soil-Plant Effluent Disposal Systems,
W76-11104 2G

HYDRAULIC MODELS
Hydraulic Model Studies of Mechanical Mixing Devices in Stratified Lakes,
W76-11495 8B

HYDROBIOLOGY
The Application of 'Biotic Indices' to the Study of Pollution in a River with Cyprinidae, (In French),
W76-11580 5A

HYDROCARBONS
Conclusion and Recommendations Conference/Workshop,
W76-11485 6G

HYDROGEN ION CONCENTRATION
Long-Term Acidification of a Lake and Resulting Effects on Fishes,
W76-11178 5C

Oligotrophication - A Self-Accelerating Process In Lakes Subjected to Excessive Supply of Acid Substances,
W76-11403 5C

HYDROGRAPHS
The Impact of Suburbanization on Stream Networks,
W76-11113 4C

HYDROLOGIC ASPECTS
Dynamic Modelling and Control Applications in Water Quality Maintenance,
W76-11142 5G

HYDROLOGIC DATA
Sources of Water Quality, Lake Level, Ice, Water Temperature, and Meteorological Data for the St. Lawrence Great Lakes,
W76-11363 7C

Statistical Summaries of Indiana Streamflow Data,
W76-11409 7C

Ground-Water Resources and Water Use in Southern Navajo County, Arizona,

OFFSHORE PLATFORMS
Florida Coastal Policy Study: The Impact of Offshore Oil Development,
W76-11468 6G

OHIO
Flood Plain Information: Alum Creek, Vicinity of Columbus, Ohio.
W76-11360 4A

OIL
Ecotoxicology of Crude Oils and the Use of Experimental Marine Ecosystems,
W76-11586 5C

OIL INDUSTRY
Proceedings of the Symposium on Offshore Oil Potential and Related Land use Impacts in the Central California Coastal Zone.
W76-11461 6G

Texas Coastal Management Program. Hearing Draft.
W76-11466 6B

Introduction,
W76-11469 6G

Review of Offshore Exploration in Florida,
W76-11470 6G

Environmental Impacts and Monitoring of Oil and Gas Pipelines: A Technical Note,
W76-11472 6G

Deepwater Ports: Policy Issues in Florida,
W76-11473 6G

The Department of the Interior's Outer Continental Shelf Leasing Program,
W76-11475 6G

Framework for Bureau of Land Management Programs,
W76-11476 6G

Southeast Coastal Research Activities of ERDA,
W76-11477 6G

The Alaskan Outer Continental Shelf Environmental Assessment Program,
W76-11478 6G

Offshore Operations, Regulation and Environmental Protection,
W76-11480 6G

Overview of Conference Programs,
W76-11481 6G

Physical Oceanography Considerations,
W76-11483 6G

Conclusion and Recommendations Conference/Workshop,
W76-11485 6G

OIL POLLUTION
The Microbial Degradation of Oil in the Sea,
W76-11101 5B

Cationic Polymers for Breaking Oil-In-Water Emulsions,
W76-11449 5D

Library U. of I. Urbana-Champaign

OIL POLLUTION

Observations on the Effects of Crude Oil Pollution on the Sandy-Beach Snail, Bullia (Gastropoda:Prosobranchiata), W76-11459 5C

Random Model of Evaporation of Oil at Sea, W76-11462 5B

The Alert Bay Oil Spill: A One-Year Study of the Recovery of a Contaminated Bay, W76-11463 5C

Florida Coastal Policy Study: The Impact of Offshore Oil Development, W76-11468 6G

Environmental Impacts of OCS Oil and Gas Activity, W76-11471 6G

Physical Oceanography Considerations, W76-11483 6G

Conclusion and Recommendations Conference/Workshop, W76-11485 6G

Mass Destruction of Synthliboramphus Antiquus by Oil Pollution of Japan Sea, W76-11562 5C

Supershrimp: Deep Bioturbation in the Strait of Canso, Nova Scotia, W76-11584 5C

Lipid Composition of Surface Films, and Zooplankton from the Eastern Mediterranean, W76-11585 5B

Ecotoxicology of Crude Oils and the Use of Experimental Marine Ecosystems, W76-11586 5C

Effects of Crude Oil and Dispersants on Bi-Valves, W76-11591 5C

Toxicity of Oil-Sinking Agents, W76-11592 5C

OIL SPILLS

The Microbial Degradation of Oil in the Sea, W76-11101 5B

Studies on the Susceptibility of Ankistrodesmus Species to Crude Oil Components, W76-11195 5C

Source Identification of Fuel Oil Spills, W76-11314 5A

Field Studies on the Phytotoxicity of Crude Oil to Subarctic Aquatic Vegetation, W76-11405 5C

Random Model of Evaporation of Oil at Sea, W76-11462 5B

The Alert Bay Oil Spill: A One-Year Study of the Recovery of a Contaminated Bay, W76-11463 5C

Florida Coastal Policy Study: The Impact of Offshore Oil Development, W76-11468 6G

Environmental Protection Agency's Role, Interests, and Responsibilities with Respect to the Outer Continental Shelf Development, W76-11479 6G

Biological Considerations, W76-11484 6G

Lipid Composition of Surface Films, and Zooplankton from the Eastern Mediterranean, W76-11585 5B

Toxicity of Oil-Sinking Agents, W76-11592 5C

OIL WASTES

Petroleum Compounds in the Marine Food Web: Short-Term Experiments on the Fate of Naphthalene in Calanus, W76-11181 5C

The Effects of Aqueous Extracts of Crude Oil and Naphthalene on the Physiology and Morphology of a Freshwater Green Alga, W76-11404 5C

OILY WATER

Cationic Polymers for Breaking Oil-In-Water Emulsions, W76-11449 5D

Lipid Composition of Surface Films, and Zooplankton from the Eastern Mediterranean, W76-11585 5B

Effects of Crude Oil and Dispersants on Bi-Valves, W76-11591 5C

OILY WATERS

Toxicity of Oil-Sinking Agents, W76-11592 5C

OKLAHOMA

Ground-Water Records for Northeastern Oklahoma: Part 1--Records of Wells, Test-Holes, and Springs, W76-11412 7C

OLIGOCHAETES

Composition of the Oligochaete Fauna of Central Lake Michigan, W76-11323 5C

OLIGOTROPHICATION

Oligotrophication - A Self-Accelerating Process In Lakes Subjected to Excessive Supply of Acid Substances, W76-11403 5C

OLIGOTROPHY

Oligotrophication - A Self-Accelerating Process In Lakes Subjected to Excessive Supply of Acid Substances, W76-11403 5C

Invertebrate Fauna of the Lakes of the Lower Tareya River (Western Taimyr), (In Russian), W76-11537 5C

Bacterial Populations in Skadar Lake, (In Serbo-Croatian), W76-11538 5C

OLIOTROPHY

Bacteriocoenotic Studies on an Oligotrophic Stream, (In German), W76-11534 5C

ON-SITE INVESTIGATIONS

Pre-Treatment of Water Supplies Utilizing Ferric Chloride, W76-11252 5F

Vertical Motions Along the North Shore of Lake Superior, W76-11311 2H

ON-SITE TESTS

Water Factory 21, W76-11273 5D

OPEN CHANNEL FLOW

Transverse Dispersion in Partially Stratified Tidal Flow, W76-11486 2L

OPERATION AND MAINTENANCE

Testing and Application of Static Aerators, W76-11372 5D

OPTICAL PROPERTIES

The Meaning and Measurement of Turbidity, W76-11240 5A

Optical Properties of the Great Lakes, W76-11440 XII

OPTICAL TRANSMITTANCE

Optical Properties of the Great Lakes, W76-11440 XII

OPTIMIZATION

Optimization of Water Distribution Network Systems, W76-11133 8B

ORGANIC COMPOUNDS

Petroleum Compounds in the Marine Food Web: Short-Term Experiments on the Fate of Naphthalene in Calanus, W76-11181 5C

The Baltic Sea Pollution, W76-11185 5C

Aerobic Thermophilic Treatment of High Strength Wastewaters, W76-11204 5D

Process for Treating Waste Water, W76-11217 5D

Problems in Analyses of Organic Pollutants in Open-Ocean Samples, W76-11239 5A

Analysis of Organic Pollutants in Drinking Water, W76-11242 5A

Monitoring for Organic Pollutants in Grea Britain, W76-11244 5A

Identification of Stable Organic Compounds i Waste Effluent, W76-11338 5A

Hygienic Evaluation of an Epoxy Compoun and the Possibility of its Use in Submersibl Electric Pumps for Domestic Purposes, (I Russian), W76-11528 5

Toxicity of Oil-Sinking Agents, W76-11592 5

Identification of Organic Compounds in E fluents from Industrial Sources, W76-11598

Fine Particles and Water Quality in the Coas Marine Environment, W76-11612

ORGANIC WASTES

Municipal Wastes as a Fertilizer Source, W76-11117

Method and Apparatus for Treating Liq Sewage and Waste, W76-11220

aratus for Disposing of Organic Waste erials,
-11455 5E

ent Changes in Atlantic Salmon (Salmo r) runs in the Light of Environmental nges in the Saint John River, New Brunk, Canada,
-11508 5C

nic Pollution in Ensenada Bay, Mexico,
-11587 5B

NOLEPTIC PROPERTIES
ienic Evaluation of an Epoxy Compound the Possibility of its Use in Submersible tric Pumps for Domestic Purposes, (In ian),
-11528 5C

NOPHOSPHOROUS PESTICIDES
e Toxicity of Certain Pesticides to Acartia a Dana,
-11193 5C

LATORIA
ico-Chemical Parameters of the Hydronic System of Lake Nantua: Relation with latoria, (In French),
-11575 5C

R CONTINENTAL SHELF
Microbial Degradation of Oil in the Sea,
-11101 5B

eedings of the Symposium on Offshore Oil ntial and Related Land use Impacts in the ral California Coastal Zone.
-11461 6G

om Model of Evaporation of Oil at Sea,
11462 5B

s Coastal Management Program. Hearing . Executive Summary.
11465 6B

s Coastal Management Program. Hearing
11466 6B

s Coastal Management Program. Hearing . Appendices.
11467 6B

la Coastal Policy Study: The Impact of ore Oil Development,
11468 6G

duction,
11469 6G

w of Offshore Exploration in Florida,
11470 6G

onmental Impacts of OCS Oil and Gas ity,
11471 6G

onmental Impacts and Monitoring of Oil as Pipelines: A Technical Note,
11472 6G

water Ports: Policy Issues in Florida,
11473 6G

u of Land Management's Environmental s Program for the South Atlantic Outer nental Shelf Area. Conference/Workshop edings,
11474 6G

The Department of the Interior's Outer Continental Shelf Leasing Program,
W76-11475 6G

Framework for Bureau of Land Management Programs,
W76-11476 6G

Southeast Coastal Research Activities of ERDA,
W76-11477 6G

The Alaskan Outer Continental Shelf Environmental Assessment Program,
W76-11478 6G

Environmental Protection Agency's Role, Interests, and Responsibilities with Respect to the Outer Continental Shelf Development,
W76-11479 6G

Offshore Operations, Regulation and Environmental Protection,
W76-11480 6G

Overview of Conference Programs,
W76-11481 6G

Geological Oceanography Considerations,
W76-11482 6G

Physical Oceanography Considerations,
W76-11483 6G

Biological Considerations,
W76-11484 6G

Conclusion and Recommendations Conference/Workshop,
W76-11485 6G

OUTLETS
Water Supply and Wastewater Disposal - Planning and Problems - In Coastal Areas,
W76-11225 5D

Ocean Outfall Disposal Systems,
W76-11226 5D

Environmental Assessment of Marine Outfalls,
W76-11615 5E

OVER-WATER MEASUREMENTS
Generalized Profiles of Wind Speed, Temperature and Humidity,
W76-11304 2H

OVERLAND FLOW
Land Treatment of Municipal Wastewater,
W76-11207 5D

Land Application of Wastewater.
W76-11231 5D

Land Application Research at Robert S. Kerr Environmental Research Laboratory,
W76-11232 5D

Land Application Practices and Design Criteria,
W76-11233 5D

Overland Flow Treatment of Wastewater - A Feasible Approach,
W76-11235 5D

Land Application of Treated Sewage in the Mountain State,
W76-11237 5D

OXIDATION
Wet Air Oxidation at Ontonagon,
W76-11384 5D

OXIDATION LAGOONS
Removal of Algae from Waste Stabilization Pond Effluent,
W76-11171 5D

OXYGEN
Uptake Pathways and Elimination of a Nonionic Surfactant in Cod (Gadus Morrhua L.),
W76-11182 5C

Chesapeake Corporation Operating Experience with a High Purity Oxygen Activated Sludge Waste Treatment System,
W76-11377 5D

OXYGENATION
Hypolimnion Oxygenation,
W76-11454 5G

OZONE
Effects of Sulfur Dioxide and/or Ozone on Several Oat Varieties, 1975 Annual Report,
W76-11190 5C

Ozone Provides Alternative for Secondary Effluent Disinfection Part 3,
W76-11213 5D

PACIFIC NORTHWEST U. S.
Establishing Instream Flows: Analysis of the Policy-Making Process in the Pacific Northwest,
W76-11339 6B

Evolution of the Cations Involved in Rain, Canopy Leachate and Drainage Water through a Forest Ecosystem, (In French),
W76-11540 2G

PACIFIC OCEAN
The Principal Aspects of Desalination of Surface Waters of the Tropical Southwestern Pacific, (In French),
W76-11539 2D

PAKISTAN
Management of Water Resources Under Different Socio-Economic Conditions,
W76-11514 6B

PATENTS
Acid Treated Cationic Starch in the Flocculation and Dewatering of Sludge,
W76-11214 5D

Process for Converting Aqueous Sewage to Potable Water,
W76-11215 5D

System for Treating Sludge,
W76-11216 5D

Process for Treating Waste Water,
W76-11217 5D

Method of Processing Refuse and/or Sludge and A Plant for Carrying out the Method,
W76-11218 5D

Sewer Waste Water Treating Agent Produced from Waste Cracking Catalyst,
W76-11219 5D

Method and Apparatus for Treating Liquid Sewage and Waste,
W76-11220 5D

Compositions for Treating Domestic and Industrial Liquid Wastes,
W76-11221 5D

LIBRARY U. OF I. URBANA-CHAMPAIGN

PATENTS

Integral Circular Wastewater Treatment Process,
W76-11222 5D

Process for the Purification of Waste Waters,
W76-11223 5D

Water Current Force Measuring Apparatus,
W76-11444 7B

Rotatable Sprinkler and Water Deflector Used Therewith,
W76-11445 3F

Sprinkler Adjustment,
W76-11446 3F

Process for the Regeneration of Ion-Exchange Resins and Applications Thereof,
W76-11447 3A

Process for Separating Liquids from Suspensions,
W76-11448 5D

Cationic Polymers for Breaking Oil-In-Water Emulsions,
W76-11449 5D

Flocculation Process,
W76-11451 5D

Process for the Precipitation of Heavy Metal Ion-Polycarboxylate Complexes,
W76-11452 5D

Hypolimnion Oxygenation,
W76-11454 5G

Apparatus for Disposing of Organic Waste Materials,
W76-11455 5E

Underdrain for Water Filtration System,
W76-11458 5F

PATH OF POLLUTANTS

Effect of Tillage Systems on Runoff Losses of Pesticides: A Simulated Rainfall Study,
W76-11169 5B

Petroleum Compounds in the Marine Food Web: Short-Term Experiments on the Fate of Naphthalene in Calanus,
W76-11181 5C

Ecology of the Littoral Polychaete Streptosyllis Websteri, A New Species in the Baltic,
W76-11186 5B

Field Observations of the Dynamics of Heated Discharge Jets,
W76-11307 5B

Modeling Chloride Distribution in Saginaw Bay,
W76-11312 5B

Ground-Water Flow and Pollution at a Well Field, Olean, New York,
W76-11417 5B

IFYGL Stream Materials Balance Study,
W76-11429 5B

A Model for the Study of Episodes in the Dispersion of a Conservative Pollutant in Lake Michigan,
W76-11442 5B

The Dispersion of Pollutants Beneath Open Channels,
W76-11443 5B

Modeling the Fates of Metals in Ocean-Discharged Wastewaters,
W76-11464 5B

The Problem of Mercury in the Mediterranean, (In French),
W76-11531 5B

Organic Pollution in Ensenada Bay, Mexico,
W76-11587 5B

Modeling Solute Transport in Ground Water,
W76-11605 5B

PEAK DISCHARGE

Flood Plain Information: Pogues Run, Pleasant Run, and Bean Creek, Marion County, Indiana.
W76-11354 4A

PERCOLATION

Land Application Research at Robert S. Kerr Environmental Research Laboratory,
W76-11232 5D

Land Application Practices and Design Criteria,
W76-11233 5D

Infiltration-Percolation Systems,
W76-11236 5D

Wastewater Reuse in Coastal Areas,
W76-11620 5D

PERMEABILITY

Petrographic and Geohydrologic Model of Aquifer Limestones in Florida,
W76-11493 2F

PERMITS

Environmental Assessment of Marine Outfalls,
W76-11615 5E

PERSISTENCE

Phenoxy Herbicide Residues and Their Persistence,
W76-11151 5B

PESTICIDE DRIFT

Fundamentals of Drift Control by Droplet Size Selection,
W76-11148 5G

Effect of Tillage Systems on Runoff Losses of Pesticides: A Simulated Rainfall Study,
W76-11169 5B

PESTICIDE RESIDUES

Phenoxy Herbicide Residues and Their Persistence,
W76-11151 5B

Effect of Tillage Systems on Runoff Losses of Pesticides: A Simulated Rainfall Study,
W76-11169 5B

The Baltic Sea Pollution,
W76-11185 5C

Method of Determining Residues of the Herbicide Lenacil in Water, Soil and Sugar Beets, (In Rusian),
W76-11527 5A

Hygienic Evaluation of Polychloropinene and Alkylbenzene Sulfonate Present Together in Surface Waters, (In Russian),
W76-11530 5C

Absorption and Accumulation of Pesticides Residues and Chlorinated Biphenyls in Both Wild Aquatic Vegetation and Rice in the Camargue Region, (In French),
W76-11582 5C

PESTICIDE TOXICITY

Herbicide Toxicity in Mangroves,
W76-11192 5C

Acute Toxicity of Certain Pesticides to Acartia Tonsa Dana,
W76-11193 5C

PESTICIDES

Effects, Uptake and Metabolism of Methoxychlor, Mirex, and 2,4-D in Seaweeds,
W76-11189 5C

PETROGRAPHY

Petrographic and Geohydrologic Model of Aquifer Limestones in Florida,
W76-11493 2F

PETROLEUM HYDROCARBONS

Lipid Composition of Surface Films, and Zooplankton from the Eastern Mediterranean,
W76-11585 5B

PETROLEUM-OXIDIZING BACTERIA

Petroleum-Oxidizing Bacteria Accompanying Higher Aquatic Plants, (In Russian),
W76-11572 5

PHENOLIC RESINS

Possibility of Using Phenolic Resins Household and Drinking Water Supply Systems, (In Russian),
W76-11560 5

PHENOLS

The Hypothalamo-Hypophyseal Neurosecretory System of the Guppy Lebistes Reticulatus Under Chronic Phenol Intoxication, (In Russian),
W76-11549

The Determination of Phenols in Water: Chromatographic Identification by Means of the Electron Affinity, (In German),
W76-11552

Possibility of Using Phenolic Resins Household and Drinking Water Supply Systems, (In Russian),
W76-11560

PHOSPHATES

Changes in Phytoplankton Following Nitrate Phosphate Additions to Large Enclosures in Marion Lake, British Columbia,
W76-11283

Phosphate, Algae, and Taconite Tailings in Western Arm of Lake Superior,
W76-11441

Process for Separating Liquids from Suspensions,
W76-11448

Flocculation Process,
W76-11451

Rationalization of Ionic Strength and Ca Effects on Phosphate Sorption by Soils,
W76-11507

Increase of Primary Production in a Ba Malyi Zhemchuzhnyi Island (North Cas Using Inorganic Fertilizers, (In Russian),
W76-11553

The Macrophytic Vegetation of Ru Waters in South Lower Saxony and Their tions to Water Pollution, (In German),
W76-11574

OSPHORUS
Jtilization of Stream-Borne Phosphorus by Cayuga Lake Phytoplankton,
W76-11108 5C

Relationship Between Water Quality and Plant Growth in Ponds,
W76-11170 5C

Phosphorus Mobility in Lake Ontario Sediments,
W76-11288 5B

Bacteria and Phosphorus as Indicators of the Extent of a Large Sewage Spill in Lake Erie,
W76-11315 5A

A Simulation Model for Phosphorus Waste Discharges in the Lake Erie Basin,
W76-11317 5B

OSPHORUS COMPOUNDS
Phosphorus Cycling and Luxury Phosphorus Storage by Algae in the Waters of Green Bay,
W76-11332 5C

OTOMETRY
Photometric Method for the Control of Suspended Solids in Sedimentation Tanks (Fotometricheskii metod kontrolya vzveshennykh veshchestv v otstoinikakh),
W76-11390 5A

OTOSYNTHESIS
Effects of Water Stress Under Contrasting Environmental Conditions on Transpiration and Photosynthesis in Soybean,
W76-11362 3F

The Effects of Aqueous Extracts of Crude Oil and Naphthalene on the Physiology and Morphology of a Freshwater Green Alga,
W76-11404 5C

Transpiration and Photosynthesis in Soybean: Effects of Temperature and Vapour Pressure Deficit,
W76-11407 3F

SICAL LIMNOLOGY
Survey of the Physical Limnology of Great Salt Lake,
W76-11107 2H

SICAL OCEANOGRAPHY
Physical Oceanography Considerations,
W76-11483 6G

TOPLANKTON
Utilization of Stream-Borne Phosphorus by Cayuga Lake Phytoplankton,
W76-11108 5C

Relationship Between Water Quality and Plant Growth in Ponds,
W76-11170 5C

Assessment of the Basis of Mercury Tolerance in Dunaliella Tertiolecta,
W76-11183 5C

The Baltic Sea Pollution,
W76-11185 5C

Critical Interactions in Phytoplankton Populations - An Asymptotic Eigenvalue Analysis,
W76-11277 2H

Storm Induced Relationships Among Chemical Conditions and Phytoplankton in Saginaw Bay and Western Lake Huron,
W76-11282 5C

Modeling of Phytoplankton in Lake Ontario,
W76-11286 5C

The Abundance of Diatoms in the Southwestern Nearshore Region of Lake Ontario During the Spring Thermal Bar Period,
W76-11425 2H

Phytoplankton Biomass, Species Composition and Primary Production at a Nearshore and a Midlake Station of Lake Ontario During IFYGL,
W76-11426 5C

Increase of Primary Production in a Bay of Malyi Zhemchuzhnyi Island (North Caspian) Using Inorganic Fertilizers, (In Russian),
W76-11553 5C

Effect of the Degree of Vacuum Used in Filtration on the Simultaneous Measurement of Assimilation and Excretion by Phytoplankton Organisms, (In French),
W76-11554 5C

Primary Production in the Mauritanian Upwelling in March 1973, (In French),
W76-11555 5C

Features of Freshwater Ecosystems (From the Results of Soviet Participation in the International Biological Program), (In Russian),
W76-11556 5C

Primary Production and Biotic Balance of Plankton in the Northeastern Part of the Amur Bay, (In Russian),
W76-11576 5C

Relation Between Generation Time and Biomass of Phytoplankton, (In Russian),
W76-11577 5C

The Effects of NTA on the Growth of Phytoplankton with Particular Consideration Given to Iron as a Microelement,
W76-11578 5C

Effect of Treated Sewage Effluents on Phytoplankton in Lakes, (In German),
W76-11579 5C

PHYTOTOXICITY
Field Studies on the Phytotoxicity of Crude Oil to Subarctic Aquatic Vegetation,
W76-11405 5C

Yield and Heavy Metal Content of Food Crops Grown on Soils Amended with Sewage Sludge,
W76-11610 5D

PICLORAM
Herbicide Toxicity in Mangroves,
W76-11192 5C

PIGMENTS
A Comparison of the Abundance and Diversity of Fossil Pigments in Wetland Peats and Woodland Humus Layers,
W76-11601 5C

PIKE
DDT and its Metabolites in Some Cestodes in Fishes, (In Russian),
W76-11550 5C

PIKES
Mercury Level as a Function of Size and Age in Northern Pike, One and Five Years After the Mercury Ban in Sweden,
W76-11401 5C

PILOT PLANTS
Comparative Effects of Chemical Pretreatment on Carbon Adsorption,
W76-11209 5D

Reverse Osmosis Pilot Plant Studies for the Purification and Reuse of Effluent from a Sanitary Waste Treatment Plant,
W76-11267 5D

PIPES
Optimization of Water Distribution Network Systems,
W76-11133 8B

PIT RECHARGE
Feasibility of Modelling the Influences of Pit Recharge on Groundwater Levels and Quality in Alluvial Basins,
W76-11487 2F

PLANKTON
The Effects of Variations in Turbidity on Cycles of Planktonic and Benthic Organisms in Flood Control Reservoirs,
W76-11172 5C

Studies of Plutonium Cycling and Sedimentation in Lake Michigan,
W76-11292 5B

PLANNING
Interactions Between Land Use and Urban Water Resources Planning,
W76-11130 4A

A Stochastic Programming Model Applied to Water Resources Management,
W76-11144 4A

Maintenance Management of Waterworks System,
W76-11254 5F

The Potential Impact of Satellite Data-Relay Systems on the Operation of Hydrologic Data Programs,
W76-11497 7B

Water Quality Management Planning for Urban Runoff.
W76-11600 5D

Man Discovers the Coastal Environment: A Footprint in the Sand,
W76-11621 5D

First the Water, Then the Sewer, Then Land Use Planning: Coastal Planning in Retrospect and in the Now,
W76-11622 5D

PLANT GROWTH
Effects of Bisulfite on Metabolic Development in Synchronous Chlorella Pyrenoidosa,
W76-11187 5C

Studies on the Susceptibility of Ankistrodesmus Species to Crude Oil Components,
W76-11195 5C

Drought Resistance Characteristics of Blue Grama Seedlings,
W76-11505 2I

Nitrogen-Silicon Interaction in Plants Grown in Desert Soil with Nitrogen Deficiency,
W76-11509 3F

Yield and Heavy Metal Content of Food Crops Grown on Soils Amended with Sewage Sludge,
W76-11610 5D

LIBRARY U. OF I. URBANA-CHAMPAIGN

PLANT MORPHOLOGY
The Effects of Aqueous Extracts of Crude Oil and Naphthalene on the Physiology and Morphology of a Freshwater Green Alga,
W76-11404 5C

PLANT POPULATIONS
Vertical Interactions in Phytoplankton Populations - An Asymptotic Eigenvalue Analysis,
W76-11277 2H

PLANTING MANAGEMENT
Drought Resistance Characteristics of Blue Grama Seedlings,
W76-11505 2I

Effects of Irrigation Regimes, Planting Dates, Nitrogen Levels, and Row Spacing on Safflower Cultivars,
W76-11515 3F

PLASTIC PIPES
Review of Standards and Other Information on Thermoplastic Piping in Residential Plumbing,
W76-11603 8G

PLASTICS
Review of Standards and Other Information on Thermoplastic Piping in Residential Plumbing,
W76-11603 8G

PLATICHTHYS SP.
Cadmium Uptake by Marine Fish Larvae,
W76-11184 5C

PLUMBING
Review of Standards and Other Information on Thermoplastic Piping in Residential Plumbing,
W76-11603 8G

PLUTONIUM
Plutonium Distribution in Lake Michigan Biota,
W76-11287 2H

Studies of Plutonium Cycling and Sedimentation in Lake Michigan,
W76-11292 5B

POINT PETRE (ONTARIO)
Point Petre Storm Surges Simulation,
W76-11303 2H

POLAND
Auxiliary Agents Used in Textile Finishing as New Coagulants for Effluents (Srodki pomocnicze stosowane w wykonczalnictwie jako nowe koagulanty sciekow przemyslu wlokienniczego),
W76-11501 5D

Coagulation of Textile Industry Effluents with Fixative 'IS' (Proby koagulacji sciekow przemyslu wlokienniczego Utrwalaczem IS),
W76-11502 5D

POLCHLORINATED BIPHENYL
Reduction of Field Populations of Fiddler Crabs by Uptake of Chlorinated Hydrocarbons,
W76-11588 5C

POLICY COSTS
Environmental Policy Costs: Definition, Measurement, and Conjecture,
W76-11159 5G

POLICY EVALUATION
The Role of Cost-Benefit Analysis in Policy Making,
W76-11165 6B

POLICY MAKING
The Role of Cost-Benefit Analysis in Policy Making,
W76-11165 6B

POLIOVIRUS
Certain Aspects of the Process of Enterovirus Inactivation with Chlorine, (In Russian),
W76-11568 5F

Study of the Behaviour of Poliomyelitis Virus Type 1 in Different Hydrous Media, (In French),
W76-11569 5A

POLITICAL ASPECTS
Political Resolution of Environmental Conflicts,
W76-11129 6G

Voting, Cost-Benefit Analysis, and Water Pollution Policy,
W76-11166 5G

POLLUTANT DISPERSION
A Model for the Study of Episodes in the Dispersion of a Conservative Pollutant in Lake Michigan,
W76-11442 5B

POLLUTANT IDENTIFICATION
Toxic Heavy Metals in Ground Water of a Portion of the Front Range Mineral Belt,
W76-11105 5B

Ecology of the Littoral Polychaete Streptosyllis Websteri, A New Species in the Baltic,
W76-11186 5B

Problems in Analyses of Organic Pollutants in Open-Ocean Samples,

Bacteriocoenotic Studies on an Oligotroph Stream, (In German),
W76-11534

The Statistical Approach to the Study of Small Rivers Hydrochemical Regime Western Polesye of the Ukrainian SSR, Russian),
W76-11536

The Determination of Phenols in Water: Chromatographic Identification by Means the Electron Affinity, (In German),
W76-11552

Rapid Determination of NO3 in Water, Romanian),
W76-11559

Identification of Organic Compounds in fluents from Industrial Sources,
W76-11598

Data Management: Key to Environme Quality Assessment,
W76-11607

The Role of Environmental Data Bank Energy Resource Development,
W76-11609

Validation of Environmental Measure Methodology,
W76-11614

OLLUTANTS
A Model for the Study of Episodes in the Dispersion of a Conservative Pollutant in Lake Michigan,
W76-11442 5B

OLLUTION ABATEMENT
Cost Sharing to Induce Efficient Techniques of Abating Wastewater Pollution,
W76-11135 5G

Valuing Long-Run Ecological Consequences and Irreversibilities,
W76-11161 6G

Cost-Benefit Analysis, Property Right Specification and 'Distribution',
W76-11162 6B

Project-by-Project Analysis VS. Comprehensive Planning,
W76-11163 5G

Cost-Benefit Analyses of Cost-Benefit Analysis,
W76-11164 6B

Proceedings of the Third National Conference on Complete Wateruse: Symbiosis as a Means of Abatement for Multi-Media Pollution,
W76-11257 5D

Pollution Management in the Paper and Paperboard Industry.
W76-11400 5G

Offshore Operations, Regulation and Environmental Protection,
W76-11480 6G

Overview of Conference Programs,
W76-11481 6G

Mercury in Laundry Wastewaters,
W76-11602 5D

LYCHAETES
Ecology of the Littoral Polychaete Streptosyllis Websteri, A New Species in the Baltic,
W76-11186 5B

Organic Pollution in Ensenada Bay, Mexico,
W76-11587 5B

LYCHLORINATED BIPHENYLS
Absorption and Accumulation of Pesticides Residues and Chlorinated Biphenyls in Both Wild Aquatic Vegetation and Rice in the Camargue Region, (In French),
W76-11582 5C

PCB Levels in Clyde Marine Sediments and Fauna,
W76-11589 5B

LYCHLOROPINENE
Hygienic Evaluation of Polychloropinene and Alkylbenzene Sulfonate Present Together in Surface Waters, (In Russian),
W76-11530 5C

LYELECTROLYTES
Flocculation of Wastewater with Polyelectrolytes and Ferric Chloride,
W76-11520 5D

LYMERS
Study of Water Sorption on Biopolymers, (In Russian).
W76-11532 2K

POLYNESIA
The Principal Aspects of Desalination of Surface Waters of the Tropical Southwestern Pacific, (In French),
W76-11539 2D

POLYNUCLEAR AROMATIC HYDROCARBONS
Fluorescence Measurements of Carcinogenic and Polycyclic Aromatic Hydrocarbons in Water,
W76-11243 5A

PONDEROSA PINE TREE
Water Quality of Streamflow from Ponderosa Pine Forest Watersheds on Sedimentary Soils,
W76-11490 5A

PONDS
Relationship Between Water Quality and Plant Growth in Ponds,
W76-11170 5C

Land Disposal of Wastewater,
W76-11227 5E

POOL-RAPID RIVERS
Scour and Fill Patterns in Pool-Rapid Rivers,
W76-11511 2J

POROSITY
Petrographic and Geohydrologic Model of Aquifer Limestones in Florida,
W76-11493 2F

POST-GLACIAL SEDIMENTS
The Stratigraphy of Northern Lake Superior Late-Glacial and Postglacial Sediments.
W76-11289 2J

POTABLE WATER
Process for Converting Aqueous Sewage to Potable Water,
W76-11215 5D

Analysis of Organic Pollutants in Drinking Water,
W76-11242 5A

X-Ray Diffraction and Electron Beam Analysis of Asbestiform Minerals in Lake Superior Waters,
W76-11248 5A

Proceedings of the Annual Conference, Ontario Section, American Water Works Association; Pollution Control Association of Ontario; and Ontario Municipal Water Association.
W76-11249 5F

Contemporary Chlorine Disinfection Practices in Ontario,
W76-11250 5F

Automated Fluoridation Using a Selective Ion Electrode,
W76-11251 5F

POTHOLES RESERVOIR (WASH)
The Redistributional Consequences of Public Recreation Provision at the Potholes Reservoir--Columbia Basin Project, Washington,
W76-11168 6B

POWERPLANTS
Field Observations of the Dynamics of Heated Discharge Jets,
W76-11307 5B

The Effect of a Fossil Fuel Power Plant's Cooling Water System on the Water Quality of Green Bay, Wisconsin,
W76-11319 5B

PRE-IMPOUNDMENT
Preliminary Investigations of a Headwater Creek in Eastern Kentucky,
W76-11284 5G

PRE-TREATMENT (WATER)
Pre-Treatment of Water Supplies Utilizing Ferric Chloride,
W76-11252 5F

PREDATION
Features of Freshwater Ecosystems (From the Results of Soviet Participation in the International Biological Program), (In Russian),
W76-11556 5C

PRICES
Land Prices in Flood Hazard Areas: Applying Methods of Land Value Analysis,
W76-11112 6F

PRICING
The Impact of Flooding Upon Land Values in the Big Black River Basin,
W76-11330 6C

PRIMARY PRODUCTIVITY
The Baltic Sea Pollution,
W76-11185 5C

Effects of Bisulfite on Metabolic Development in Synchronous Chlorella Pyrenoidosa,
W76-11187 5C

The Effects of Aqueous Extracts of Crude Oil and Naphthalene on the Physiology and Morphology of a Freshwater Green Alga,
W76-11404 5C

Field Studies on the Phytotoxicity of Crude Oil to Subarctic Aquatic Vegetation,
W76-11405 5C

Phytoplankton Biomass, Species Composition and Primary Production at a Nearshore and a Midlake Station of Lake Ontario During IFYGL,
W76-11426 5C

Population Dynamics and Production of Daphnia Hyalina in a Eutrophic Reservoir,
W76-11457 5C

Increase of Primary Production in a Bay of Malyi Zhemchuzhnyi Island (North Caspian) Using Inorganic Fertilizers, (In Russian),
W76-11553 5C

Primary Production in the Mauritanian Upwelling in March 1973, (In French),
W76-11555 5C

Primary Production and Biotic Balance of Plankton in the Northeastern Part of the Amur Bay, (In Russian),
W76-11576 5C

PRIOR APPROPRIATION
Evaluation of Prior Appropriation in Mississippi,
W76-11336 6E

PRODUCTIVITY
The Effects of Variations in Turbidity on Cycles of Planktonic and Benthic Organisms in Flood Control Reservoirs,
W76-11172 5C

Long-Term Acidification of a Lake and Resulting Effects on Fishes,
W76-11178 5C

LIBRARY U. OF I. URBANA-CHAMPAIGN

PRODUCTIVITY

Seasonal Mortality of Rainbow Trout (Salmo Gairdneri) Planted in Smalll Eutrophic Lakes of Central Canada,
W76-11179 5C

Studies on the Susceptibility of Ankistrodesmus Species to Crude Oil Components,
W76-11195 5C

A Comparative Study of the Effects on the Marine Environment of Wastes from Cellulose Industries in Scotland and Sweden,
W76-11402 5C

An Integrated Study on the Impact of Metallic Trace Element Pollution in the Coeur D'Alene-Spokane Rivers-Lake Drainage System,
W76-11488 5C

PROGRAM

Quality Control and Harmonization Programmes for the Assessment of Effects and the Measurement of Environmental Pollution in the European Communities,
W76-11613 5G

PROGRAMMABLE CALCULATORS

Programmable Calculators: Modern Instruments for Analyzing Hydrologic Data,
W76-11416 7B

PROJECT BENEFITS

Some Institutional and Conceptual Thoughts on the Measurement of Indirect and Intangible Benefits and Costs,
W76-11156 6B

PROJECT PLANNING

An Environmental Assessment of Impacts of Coal Development on the Water Resources of the Yampa River Basin, Colorado and Wyoming--Phase-II Work Plan,
W76-11500 5C

PROPERTY RIGHTS

Cost-Benefit Analysis, Property Right Specification and 'Distribution',
W76-11162 6B

TEXTILES
Auxiliary Agents Used in Textile Finishing as New Coagulants for Effluents (Srodki pomocnicze stosowane w wykonczalnictwie jako nowe koagulanty sciekow przemyslu wlokienniczego).
W76-11501 5D

Coagulation of Textile Industry Effluents with Fixative 'IS' (Proby koagulacji sciekow przemyslu wlokienniczego Utrwalaczem IS),
W76-11502 5D

THEORETICAL ANALYSIS
Cost Benefit Analysis and Water Pollution Policy.
W76-11153 5G

THERMAL BAR
Transient Thermal Response of Large Lakes to Atmospheric Disturbances,
W76-11439 2H

THERMAL BARS
The Abundance of Diatoms in the Southwestern Nearshore Region of Lake Ontario During the Spring Thermal Bar Period,
W76-11425 2H

THERMAL POLLUTION
Thermal Tolerance of Stored Fundulus Heteroclitus Gametes: Fertilizability and Survival of Embryos,
W76-11180 5C

Temperature, Infectious Diseases, and the Immune Response in Salmonid Fish,
W76-11191 5C

Temperature Effects of Young Yellow Perch, Perca Flavescens (Mitchill),
W76-11194 5C

Laboratory Estimates of the Seasonal Final Temperature Preferenda of Some Lake Erie Fish,
W76-11280 2H

Migratory Behavior of Fish Tagged at a Nuclear Power Plant Discharge Into Lake Michigan,
W76-11281 2H

Assessment of the Effects of Waste Heat Inputs on Water Budgets of the Great Lakes,
W76-11305 5C

A Numerical Model for Thermal Plumes and River Discharges,
W76-11310 5B

Fish Culture in Warmed Waters in the Czechoslovak Socialist Republic (Chov Ryb V Oteplenych Vodach V Ceskoslovenske Socialisticke Republice),
W76-11595 5C

THERMAL PROPERTIES
Transient Thermal Response of Large Lakes to Atmospheric Disturbances,
W76-11439 2H

THERMAL RADIATION
Preliminary Energy Budget of Lake Ontario for the Period May Through November, 1972,
W76-11433 2H

THERMAL STRATIFICATION
Hypolimnion Oxygenation,
W76-11454 5G

THERMAL STRESS
Thermal Tolerance of Stored Fundulus Heteroclitus Gametes: Fertilizability and Survival of Embryos,
W76-11180 5C

Temperature, Infectious Diseases, and the Immune Response in Salmonid Fish,
W76-11191 5C

Temperature Effects of Young Yellow Perch, Perca Flavescens (Mitchill),
W76-11194 5C

THERMAL WATER
Fish Culture in Warmed Waters in the Czechoslovak Socialist Republic (Chov Ryb V Oteplenych Vodach V Ceskoslovenske Socialisticke Republice),
W76-11595 5C

THERMOCLINE
Vertical Mixing Characteristics in the Thermocline and Hypolimnion Regions of Lake Ontario,
W76-11308 2H

Transient Thermal Response of Large Lakes to Atmospheric Disturbances,
W76-11439 2H

THERMOPHILIC BACTERIA
Aerobic Thermophilic Treatment of High Strength Wastewaters,
W76-11204 5D

THIOBACILLUS-THIOPARUS
Removal of Hydrogen Sulfide from Drinking and Industrial Water, (In Russian),
W76-11541 5F

TIDES
Flood Plain Information: Northeast Volusia County, Florida.
W76-11343 4A

Short Period Tides in Lake Ontario,
W76-11438 2H

TISSUE ANALYSIS
PCB Levels in Clyde Marine Sediments and Fauna,
W76-11589 5B

TISZA RIVER BASIN (HUNGARY)
Multi-Criterion Ranking of Alternative Long-Range Water Resource Systems,
W76-11139 6B

TOXAPHENE
Acute Toxicity of Certain Pesticides to Acartia Tonsa Dana,
W76-11193 5C

TOXICANTS
Field Studies on the Phytotoxicity of Crude Oil to Subarctic Aquatic Vegetation,
W76-11405 5C

TOXICITY
Uptake Pathways and Elimination of a Nonionic Surfactant in Cod (Gadus Morrhua L.),
W76-11182 5C

An Assessment of the Basis of Mercury Tolerance in Dunaliella Tertiolecta.
W76-11183 5C

Effects of Bisulfite on Metabolic Development in Synchronous Chlorella Pyrenoidosa.
W76-11187 5C

The Toxicity of the Herbicide Dichlobenil to Goldfish (Carassius Auratus),
W76-11188 5C

Effects of Sulfur Dioxide and/or Ozone on Several Oat Varieties, 1975 Annual Report,
W76-11190 5C

Herbicide Toxicity in Mangroves,
W76-11192

Acute Toxicity of Certain Pesticides to Acartia Tonsa Dana,
W76-11193

How to Dispose of Toxic Substances and Industrial Wastes,
W76-11368

Toxicity: Research and Regulation,
W76-11374

Acute Toxicities of Spruce and Hemlock Bark Extracts to some Estuarine Organisms of Southeastern Alaska,
W76-11393

On-Site Bioassay Testing at Cariboo Pulp and Paper,
W76-11394

The Effects of Aqueous Extracts of Crude Oil and Naphthalene on the Physiology and Morphology of a Freshwater Green Alga,
W76-11404

Recent Changes in Atlantic Salmon (Salmo Salar) runs in the Light of Environmental Changes in the Saint John River, New Brunswick, Canada,
W76-11508

Effect of Pyridine Dissolved in Water on Gastric and Intestinal Mucosa of Experimental Animals, (In Russian),
W76-11526

Sanitary-Toxicologic Assessment of Iron Compounds, (In Russian),
W76-11547

The Hypothalamo-Hypophyseal Neurosecretory System of the Guppy Lebistes Reticulatus Under Chronic Phenol Intoxication, (In Russian),
W76-11549

Detoxication in Plants of Toxic Substances from Industrial Sewage Used for Irrigation, (In Russian),
W76-11567

Ecotoxicology of Crude Oils and the Experimental Marine Ecosystems,
W76-11586

Effects of Crude Oil and Dispersants on Valves,
W76-11591

Toxicity of Oil-Sinking Agents,
W76-11592

ACE ELEMENTS
tream Sediment Composition: An Aid to ater Quality Assessment,
76-11367 5A

n Integrated Study on the Impact of Metallic ace Element Pollution in the Coeur D'Alene-okane Rivers-Lake Drainage System,
76-11488 5C

CE METAL IONS
Investigation of Three Methods for the termination of Sub-micromolar ion Concentions in Water,
76-11331 5A

CE METALS
Integrated Study on the Impact of Metallic ace Element Pollution in the Coeur D'Alene-okane Rivers-Lake Drainage System,
76-11488 5C

CERS
roleum Compounds in the Marine Food b: Short-Term Experiments on the Fate of phthalene in Calanus,
6-11181 5C

CKING TECHNIQUES
mple Tracking Data Management System,
6-11611 7C

ISPIRATION
ects of Water Stress Under Contrasting Enonmental Conditions on Transpiration and tosynthesis in Soybean,
5-11362 3F

nspiration and Photosynthesis in Soybean: ects of Temperature and Vapour Pressure cit,
5-11407 3F

SVERSE DISPERSION
sverse Dispersion in Partially Stratified l Flow,
-11486 2L

TMENT FACILITIES
T Energy Needs a Prime Concern,
-11198 5D

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.

- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.

- Eastern United States water law at the College of Law of the University of Florida.

- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.

- Water resources economics at the Water Resources Center of the University of Wisconsin.

- Eutrophication at the Water Resources Center of the University of Wisconsin.

- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

- Water well construction technology at the National Water Well Association.

- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.

- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.

- Agricultural livestock waste at East Central State College, Oklahoma.

- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

LIBRARY U. OF I. URBANA-CHAMPAIGN

VOLUME 9, NUMBER 22
NOVEMBER 15, 1976

The Library of the
DEC 7 1976
University of
at Urbana-Champaign

W76-11626 -- W76-12150
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

LIBRARY OF THE UNIVERSITY OF ILLINOIS URBANA-CHAMPAIGN

VOLUME 9, NUMBER 22
NOVEMBER 15, 1976

W76-11626 -- W76-12150

tary of the U.S. Department of the Interior has de-
hat the publication of this periodical is necessary in the
n of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

lected Water Resources Abstracts, a semimonthly ournal, includes abstracts of current and earlier pertinent ographs, journal articles, reports, and other publication ats. The contents of these documents cover the water-ed aspects of the life, physical, and social sciences as as related engineering and legal aspects of the charac-ics, conservation, control, use, or management of water. abstract includes a full bibliographical citation and a set scriptors or identifiers which are listed in the **Water urces Thesaurus.** Each abstract entry is classified into elds and 60 groups similar to the water resources re-h categories established by the Committee on Water urces Research of the Federal Council for Science and nology.

IC IS NOT PRESENTLY IN A POSITION TO PROVIDE ES OF DOCUMENTS ABSTRACTED IN THIS JOUR-Sufficient bibliographic information is given to enable rs to order the desired documents from local libraries er sources.

ted Water Resources Abstracts is designed to serve ientific and technical information needs of scientists, eers, and managers as one of several planned services Water Resources Scientific Information Center IC). The Center was established by the Secretary of the r and has been designated by the Federal Council for ce and Technology to serve the water resources com-by improving the communication of water-related ch results. The Center is pursuing this objective by co-ting and supplementing the existing scientific and tech-nformation activities associated with active research vestigation program in water resources.

vide WRSIC with input, selected organizations with water resources research programs are supported as rs of competence" responsible for selecting, abstract-ing, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes

01 NATURE OF WATER
Includes the following Groups: Properties, Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

rs: *Hypsometric integral, Siltstones, n basins, Plateau basins.

streamflow duration and base flow reces-ves for eight watersheds draining sand-tstone-shale terranes in the Appalachian and Folded Appalachian Mountains of vania reflect variations in areal distribu- state of structural deformation of shal-hologic units. The hypsometric integral been used as a rapid reconnaissance e to evaluate hydrology characteristics ıantify the effects of lithology and struc-ormation on low streamflow. The HI pro-easure of the areal extent of sandstone in tershed, and the magnitude of summer w (sq ft/s/sq mi) increases as the value of al increased, to indicate a higher percent one. Streamflow duration data from the inces showed that siltstone-shale areas in tain province can produce as much low w per unit area as sandstone areas in the rovince. Short-term, summer studies of mflow characteristics are good measures rm, low streamflow characteristics. Thus sible to evaluate water resources with urveys at reduced expenses. (Roberts -

Identifiers: *Erlang distribution, *Inter-arrival time, *Snowy Mountains Region(Australia), Sinuosity.

The use of Erlang distribution for modelling inter-arrival times between flow peaks was proposed. Application to empirical data revealed that distributions so modelled change downstream, and that such modification can be accounted for by channel sinuosity and inflow. (Terstriep - ISWS)

A HYPOTHESIS FOR URBAN RAINFALL ANOMALIES,
Illinois State Water Survey, Urbana.
S. A. Changnon, Jr., R. G. Semonin, and F. A. Huff.
Journal of Applied Meteorology, Vol. 15, No. 6, p 544-560, June 1976. 22 fig, 41 ref. NSF AEN73-07796, ERDA AT(11-1)-1199.

Descriptors: *Rainfall, *Rainfall disposition, *Cities, *Missouri, Precipitation(Atmospheric), Rainfall intensity, Excessive precipitation, Urbanization, Industries, Air pollution, Weather modification, Storms, Rain, Meteorology.
Identifiers: *METROMEX, *St. Louis(Mo), Urban effects.

METROMEX was the first major field program aimed at studying the reality and causes of urban rainfall anomalies suggested in several climatological studies. The results from the 1971-74 METROMEX data portray statistically significant increases in summer rainfall, heavy (greater than 2.5 cm) rainstorms, thunderstorms and hail in and just east (downstorm) of St. Louis. Examination of the rainfall yield of individual showers (cells), the spatial distribution of echo (rain) developments, and areal distribution of afternoon rain clearly point to the urban-industrial complex as the site for the favored initiation of the rain process under certain conditions. The greater frequency of rain initiations over the urban and industrial areas appear to be tied to three urban-related factors including thermodynamic effects leading to more clouds and greater incloud instability, mechanical and thermodynamic effects that produce confluence zones where clouds initiate, and enhancement of the coalescence process due to giant nuclei. Case studies reveal that once additional cells are produced, nature, coupled with the increased likelihood for merger with more storms per unit area, takes over and produces heavier rainfalls. Hence, the city is a focal point for both rain initiation and rain enhancement under conditions when rain is likely. (Sims - ISWS)

THE DEGREE OF COMMON ORIENTATION OF HYDROMETEORS OBSERVED BY POLARIZATION DIVERSITY RADARS,
National Research Council of Canada, Ottawa (Ontario).
A. Hendry, G. C. McCormick, and B. L. Barge.
Journal of Applied Meteorology, Vol. 15, No. 6, p 633-640, June 1976. 6 fig, 3 tab, 15 ref, 1 append.

Descriptors: *Precipitation(Atmospheric), *Radar, *Rain, *Hail, Instrumentation, Investigations, Raindrops, Ice, Remote sensing, Electrical engineering, Meteorology.
Identifiers: *Hydrometeors, *Orientation of hydrometeors, Precipitation particles.

Measurements were presented of the extent to which a common alignment of hydrometeors exists in various forms of precipitation. The observations, obtained with circularly-polarized radars situated at Penhold, Alberta, and Ottawa, Ontario, were made at wavelengths of 10.4 and 1.82 cm respectively. Good agreement between results obtained at these two wavelengths was found for observations made on similar classes of precipitation. The degree of preferred alignment was high (typically 75%) in moderate or heavy rain; the presence of ice-phase hydrometeors was usually associated with a low degree of orientation. The degree of orientation, in conjunction with other parameters, was useful for the identification of the precipitation particles. Limitations on its usefulness imposed by propagation effects and by multiple scattering were discussed briefly. (Sims - ISWS)

W. R. Sand.
Journal of Applied Meteorology, Vol. 15, No. 6, p 641-650, June 1976. 5 fig, 1 tab, 33 ref. NSF C-460, NCAR 182-71.

Descriptors: *Thunderstorms, *Aircraft, *Radar, Hail, Precipitation(Atmospheric), Rainfall, Lightning, Turbulence, Storms, Particle size, Cloud physics, Meteorology.
Identifiers: *Hailstorms, Liquid water content, Updrafts, Aircraft icing.

This study related data gathered during the penetration of hailstorms between 4.9 and 6.7 km MSL by an armored T-28 aircraft to detailed radar data of the hailstorms penetrated. These data recorded by the T-28 data system were combined

LIBRARY U. OF I. URBANA-CHAMPAIGN

with observations made by the author while piloting the T-28 through hailstorms. The radar data from the National Hail Research Experiment CPR-2 were specially prepared as Constant Altitude Plan Position Indicator (CAPPI) displays and vertical sections along the aircraft track for comparison with the data gathered by the aircraft system and pilot's observations. The results indicated that significant updrafts are frequently found well ahead of the high radar reflectivity zones. The updrafts were found to be relatively smooth while the high radar reflectivity zones were found to be very turbulent. Significant quantities of supercooled liquid water were found in the updraft regions. Significant airframe icing was found in the strong updrafts with the most severe icing along the edges of the updrafts. The high reflectivity zones were found to contain almost exclusively ice. Hail was more frequently found in the area of strong reflectivity, but small hail was found outside the 40 dBZ contour. (Sims - ISWS)

HYDROMETEOROLOGY OF HEAVY RAINSTORMS IN CHICAGO AND NORTHEASTERN ILLINOIS, PHASE I - HISTORICAL STUDIES,
Illinois State Water Survey, Urbana.
F. A. Huff, and J. L. Vogel.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-257 062, $4.50 in paper copy, $3.00 in microfiche. ISWS Report of Investigation 82, 1976. 63 p, 22 fig, 18 tab, 30 ref. NSF ENV76-01447.

Descriptors: *Rainfall, *Excessive precipitation, *Cities, *Illinois, Precipitation(Atmospheric), Rainfall disposition, Rainfall intensity, Hydrology, Urban hydrology, Climatology, Meteorology, Storms, Floods, Storm water, Storm runoff, Weather, Depth-area curves, Depth-area-duration analysis, Structures, Hydraulic structures.
Identifiers: *Northeastern Illinois, *Chicago(Ill).

This report presents the results of an investigation of heavy rainstorms in the Chicago urban area and the surrounding six counties, based on available historical data of rainfall and associated weather conditions. The counties are Cook, Du Page, Kane, Will, Lake, and McHenry. Frequency distributions of point rainfall are presented for rain periods from 5 minutes to 72 hours and recurrence intervals of 6 months to 50 years. Also presented are the relationship between point and areal mean rainfall frequencies, time and space distribution characteristics of heavy rains, orientation and movement of storms, the frequency distribution of storm centers, synoptic weather conditions associated with severe rainstorms, and the diurnal, monthly, and seasonal distribution of flood-producing storms. Results of this investigation are particularly useful in hydrologic design problems, such as in the design of urban storm sewer systems, but have application also in agriculture, environmental problems, and various phases of climatology and hydrometeorology. This historical study is the first phase of a comprehensive hydrometeorological research program for northeastern Illinois. The second phase will involve an extensive field and analysis program utilizing a large rain-gage network, weather radars, and other meteorological equipment to acquire the hydrometeorological knowledge needed to optimize the design and operation of sophisticated water resources systems. (Sims-ISWS)

INVESTIGATION AND CALCULATIONS OF ICE JAMS,
A. N. Chizhov.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-014 887, $5.50 in paper copy, $3.00 in microfiche. Cold Regions Research and Engineering Laboratory Draft Translation 473, March 1975. 106 p, 23 fig, 16 tab, 52 ref. Translated from Trudy Gosudarstvennogo Gidrologicheskogo Instituta, No. 219, 1974. 88 p.

Descriptors: *Ice jams, *Rivers, *Cold regions, Ice, Ice cover, Model studies, Ice loads, Powerplants, Electric powerplants, Hydroelectric powerplants, Dams, Tailwater, Remote sensing, Aerial photography, Hydrology.
Identifiers: *USSR.

This collection of six papers is concerned with the questions of ice jam phenomena on rivers. The articles indicate the quantitative tendencies in the formation of ice jams on the Dnestr River based on materials obtained from observations of past years, full-scale and model investigations, the results from studying the tendencies in ice jam phenomena in the tailwaters of hydroelectric power plants; plus a procedure for calculating these occurrences. The authors also expound on the experience gained in modeling the movement of slush ice beneath an ice cover and the results obtained from aerial photographing of jams occurring on rivers. (Sims-ISWS)

PRESSURES OF THERMAL ORIGIN EXERTED BY ICE SHEETS UPON HYDRAULIC STRUCTURES,
Laval Univ., Quebec. Lab. of Ice Mechanics.
M. Drouin, and B. Michel.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-014 938, $11.75 in paper copy, $3.00 in microfiche. Cold Regions Research and Engineering Laboratory Draft Translation 427, October 1974. 405 p, 186 fig, 21 plate, 37 tab, 112 ref, 4 append. Translated from Laval University Mechanics of Ice Laboratory Report S-23.

Descriptors: *Ice, *Thermal properties, *Hydraulic structures, Iced lakes, Structures, Laboratory tests, Model studies, Temperature, Physical properties, Ice loads, Lake ice, Rheology, Stress, Strain, Strain measurement, Snowpacks, Mechanical properties.
Identifiers: *Ice sheets.

Ice expands or contracts as a function of temperature variation. Partial or total restriction of the expansion of a sheet of ice gives rise to conditions of stress which the engineer must consider in analyzing the stability of hydraulic structures. Each has its own particular characteristics the principle ones are the following: meteorological conditions texture and structure of the ice, topography of banks, thickness of the ice, thickness and density of the snow covering the ice, and cracks in the ice sheet. The objective of this research was to study pressures of thermal origin exerted by an ice sheet as a function of these parameters. This study began with a bibliographic compendium of the principle theories elaborated from 1922 to 1968. The analysis and discussion of these investigations showed the complexity of the problem and the importance of determining at the start the rheological characteristics of the principle types of ice. The paper discussed, in order, thermal properties of ice, heat transfer through ice sheets, types of rise in air temperatures in the Quebec region, and rheological behavior of snow-pack ice and columnar ice deformed in simple compression. The results of these studies were used in calculations of pressures of thermal origin exerted by ice sheets restrained in one direction. Finally a discussion of the effects of biaxial conditions of restraint, of the presence of snow upon the ice, and of cracks in an ice sheet was presented. (Sims-ISWS)

A POINT ENERGY AND MASS BALANCE MODEL OF A SNOW COVER,
National Weather Service, Silver Spring, Md. Office of Hydrology.
E. A. Anderson.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. National Oceanic and Atmospheric Administration Technical Report NWS 19, February 1976. 150 p, 32 fig, 13 tab, 85 ref, 1 append.

Descriptors: *Snow cover, *Model studies, *Energy transfer, Radiation, Snowmelt, Temperature, Energy budget, Heat transfer, Mathematical models, Computer models, Snow, Ice, Water resources, Energy, Melting, Hydrology, Equations.
Identifiers: *Mass balance, *Energy exchange, Finite-difference equations, Newton-Raphson iteration technique.

A point energy and mass balance model was developed for a snow cover. The model was based on two equations. These were the snow cover energy balance equation and the equation for energy transfer within a snow cover. The snow cover was divided into finite layers. Implicit finite-difference expressions, based on the two equations, were written for each layer. This set of non-linear finite-difference equations was solved by use of the Newton-Raphson iteration technique. The model also included mathematical representations of the densification of the snow and the retention and transmission of liquid-water. The model was tested on an extensive, high-quality set of data obtained as part of a cooperative snow research project between NOAA and the Agricultural Research Service near Danville, Vermont. Six years of data were used. The comparison of observed and computed values of snow cover outflow, water-equivalent, temperature, and density, plus snow surface temperature and density was quite good. The results obtained with this energy balance model were compared to results obtained with a temperature index snow cover model. The energy balance model gave improved results. These comparisons and the energy exchange theory suggest that an energy balance model should give improved results in open areas and under extreme conditions when adequate data are available. Index snow cover models should give completely adequate results in heavily forested areas. (Sims-ISWS)

AN ANALYSIS OF WATER FLOW IN DRY SNOW,
Cold Regions Research and Engineering Lab., Hanover, N. H.
S. C. Colbeck.
Water Resources Research, Vol. 12, No. 3, p 523-527, June 1976. 3 fig, 1 tab, 12 ref. Army 4A161102B52E.

Descriptors: *Water supply, *Snow, Water, Advection, Water measurement, Runoff, Wetting, Temperature, Adsorption, Flow rates, Thermodynamic behavior, Flow, Grain size, Time lag, Discharge(Water), Equations.
Identifiers: *Dry snow, Ripe snow, Ice grains, Wetting front, Freeze-thaw-metamorphism.

Equations describing water movement in a dry snow cover were derived, and examples of flow through ripe, refrozen, and fresh snows were given. As the leading edge of a wave of liquid water advanced into subfreezing snow, the liquid water was the principal source of the thermal energy needed to raise the snow to its melting temperature, because advection of water is generally faster than heat conduction. There are three requirements which have to be met before the wetting front can propagate past any level. First, a volume of water per unit volume of snow has to be frozen onto the snow grains in order to supply enough latent heat to raise the snow to O C. Second, a volume of water per unit volume of snow has to be supplied to fill the residual water requirement, retained as an adsorbed film, and the water held immobile in the menisci between the snow grains. Third, any additional water supplied is mobile, and in principle the wetting front propagates downward at a rate determined by the rate at which water can be supplied to raise the liquid saturation to the level which corresponds to the value of water flux just above the wetting front. These requirements delay and reduce runoff following rain on dry snow. (See also W76-11866) (Roberts-ISWS)
W76-11865

ANALYSIS OF HYDROLOGIC RESPONSE TO RAIN-ON-SNOW,
Cold Regions Research and Engineering Lab., Hanover, N. H.
S. C. Colbeck.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A013 383, $3.50 in paper copy, $3.00 in microfiche. Research Report 340, July 1975. 13 p, 5 fig, 1 tab, 11 ref, 1 append.

Descriptors: *Rainfall, *Snow, *Runoff, Snow cover, Precipitation(Atmospheric), Hydrology, Hydrologic aspects, Runoff forecasting, Snowmelt, Ice.

The equations describing water movement in a dry snow cover were derived and examples of flow through ripe, refrozen and fresh snows were given. The grain size of snow has a large effect on the timing of water discharge. Water is retained by dry snow to raise its temperature and satisfy the irreducible water saturation. These requirements delay and reduce runoff following rain on dry snow. (See also W76-11865) (Sims-ISWS)

CHARACTERISTICS OF THE FORECAST OF THE DATES OF ICE APPEARANCE IN THE LENA RIVER, OF THEIR PROBABILITY DISTRIBUTION, AND OF THE FREEZE-UP REGIME,
K. N. Polyakova.
Soviet Hydrology, Selected Papers, No. 6, p 371-377, 1974. 3 fig, 3 tab, 5 ref. Translated from Transactions of the Hydrometeorological Center of the USSR (Trudy GMRs), No. 117, p 64-73, 1974.

Descriptors: *Ice, *Rivers, *Forecasting, Model studies, Heat transfer, Freezing, Permafrost, Cold regions, Air temperature, Water temperature, Energy dissipation, Energy loss, Streamflow, Meteorology, Probability, Distribution.
Identifiers: *USSR, *Lena River(USSR).

Ice begins to form in the Lena, as in other rivers, when the water temperature nears 0 C. As a rule, grease ice appears first. If the water temperature reaches 0 C and supercools further, underwater ice crystals accumulate in windy weather or in reaches with a faster current and form so-called slush. A detailed analysis was performed for Kachug, Zhigalovo, Kirensk, Vitim, Olekminsk, Yakutsk, Zhugansk, and Kyusyur. For the date of appearance of floating ice, the date was taken of the steady appearance of slush, ice or slush run, and for the beginning of the freeze-up, the beginning date of the formation of a motionless ice cover. As a result of their unusual combinations, freeze-up occurs earliest in the lower course of the river in the Zhigansk-Kyusyur reach and in its upper course, in the Markovo-Kirensk reach. In both these reaches the average freeze-up dates are in late October. Downstream of Kirensk, in the Ichera-Peleduy reach, freeze-up is latest, on November 13-15 on the average. The rest of the river usually freezes up in the first 10 days of November. The duration of freeze-up formation along the river averages 28 days (October 18-November 15), i.e., it is twice as long as the propagation of initial ice formation. This is also the

U. S. DEPARTMENT OF COMMERCE

result of the great difference in the duration of the ice run in various reaches of the Lena. After the freeze-up, the ice thickness increases rapidly, as much as 15-20 cm over a 10-day period, until January. In January-February ice growth averages 5-10 cm and in March, 2-7 cm over a 10-day period. Maximum ice thickness in the Upper Lena is recorded in the last 10 days of March and in the Middle Lena from April 10 to 20. In the lower reach of the Lena, ice thickness continues to increase by 3-5 cm over a 10-day period until the first half of April. The ice reaches its maximum thickness at the end of April. AIR BUBBLER SYSTEMS TO SUPPRESS ICE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
G. D. Ashton.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-008 867, $4.00 in paper copy, $3.00 in microfiche. Special Report 210, September 1974. 35 p, 16 fig, 27 ref, 1 append. Army NCE-IA-73-108.

Descriptors: *Ice cover, *Ice breakup, *Bubbles, *Model studies, Bodies of water, Lakes, Rivers, Ice, Water temperature, Melting, Heat transfer, Circulation, Water circulation, Systems analysis.
Identifiers: *Air bubble systems, Ice prevention, Ice formation, Ice suppression.

Two-dimensional line source air bubbler systems used to induce convective melting of the undersurface of an ice cover over a water body were analyzed and a procedure was developed for predicting the effectiveness of the systems. Various field conditions were considered and limitations to the effectiveness of the systems were pointed out. Example applications of the concepts and the procedures were illustrated in the Appendix. (Sims-ISWS)

F. Kozma, and E. Toth.
Arch Meteorol Geophys Bioklimatol Ser B Klimatol Umweltmeteorol Strahlungsforsch. 23(1/2), p 99-110, 1975.

Descriptors: Evaporation, Lakes, Europe, Methodology, Evapotranspiration, Evaporation pans, Water balance, Climates.
Identifiers: *Reed, *Lake Fertoe(Hungary).

Hydrometeorological investigations were carried out since 1969 in the Hungarian part of Lake Ferro to determine the evaporation from the water surface and of the evapotranspiration of the regions covered by reed. The results obtained by the energenic formula of Hofmann, are compared with results obtained by applying other methods of computing evaporation. A description is given of the modified Hofmann formula, and of the results obtained with it. An analysis of the data obtained with evaporation pans relating these with some components of the water balance and with some climatic elements is given. --Copyright 1975, Biological Abstracts, Inc.

MODEL FOR PREDICTING EVAPOTRANSPIRATION FROM NATIVE RANGELANDS IN THE NORTHERN GREAT PLAINS.
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center.
C. L. Hanson.
Transactions of the American Society of Agricultural Engineers, Vol. 19, No. 3, p 471-481, May-June 1976. 5 fig, 4 tab, 42 ref.

Descriptors: *Evapotranspiration, *Range grasses, *Vegetation, *Model studies, *Great plains, Water, Energy budget, Soil water, Ranges, Forecasting, Estimating, Mathematical models, On-site data collections.
Identifiers: *Northern Great Plains, *Growing season, Potential evapotranspiration, Model calibration.

A study was made to develop a model for estimating evapotranspiration from Northern Great Plains native rangeland, based on potential evapotranspiration, available soil water, leaf area, and direct evaporation from the soil and intercepted water from plants. To calibrate and test the model, data from Gillette, Wyoming, Cottonwood, South Dakota, and Sidney, Montana, were collected and evaluated. An optimization routine was employed to obtain the parameter values of the model. To estimate potential evapotranspiration, an approximate energy balance method and the United States Weather Bureau Class A pan evaporation were used because the data required by them were available or easily computed. The approximate energy balance method required daily solar radiation and mean daily air temperature. Based on model verification, the energy balance equation and the pan evaporation equation could be used to predict daily as well as mean 5-, 7-, and 10-day potential evapotranspiration. Model evaluation also indicated that it was better to use the approximate energy balance method than the Class A pan method for potential evapotranspiration. The model predicted daily as well as mean evapotranspiration better in loam soil areas than in fine clay soil areas. (Roberts - ISWS)

EVAPOTRANSPIRATION FROM A SHORTGRASS PRAIRIE SUBJECTED TO WATER AND NITROGEN TREATMENTS,
Colorado State Univ., Fort Collins. Natural Resource Ecology Lab.
W. K. Lauenroth, and P. L. Sims.
Water Resources Research, Vol. 12, No. 3, p 437-442, June 1976. 8 fig, 1 tab, 18 ref. U.S. International Biological Program Grassland Biome. NSF GB-7824, GB-13096.

Descriptors: *Evapotranspiration, *Prairie soils, *Grasses, *Colorado, *Great Plains, Water, Nitrogen, Water balance, Soil-water-plant relationships, Energy budget, On-site investigations, Soil treatment.
Identifiers: *Shortgrass prairie, Soil-water potential, Ascalon sandy loam soil, Penman's method, Green needlegrass.

Evapotranspiration was estimated by the water balance method for three water and nitrogen treatments and a control in a shortgrass prairie in northeastern Colorado in 1971, 1972, and 1973. Nitrogen was applied at a rate of 150 kg/ha to maintain soil mineral nitrogen levels greater than or equal to 50 kg/ha above control levels with and without supplemental water. The water treatment maintained soil water potential greater than -0.8 bar during the growing season and was applied with and without nitrogen. Evapotranspiration for the control and unwatered nitrogen treatments was not different and ranged from 118 to 226 mm over the 3 years. The 3-year averages of evapotranspiration for the water plus nitrogen treatments were 505 and 578 mm, respectively. Evapotranspiration for the water plus nitrogen treatment agreed with potential evapotranspiration predicted by Penman's model. (Roberts-ISWS)

Identifiers: *Butte Basin(Calif), *Sacramento ley(Calif).

Stage and discharge data are being collect selected locations to describe the flood hydr of Butte Basin. Flooding in the basin is c primarily by overflow from the Sacramento which forms the western boundary of the Overflow from the Sacramento River is mea along four roads which cross the basin-Ord Road, Afton Boulevard, State Highway 16 Gridley Road-- and at Moulton and Colusa During the 1973 water year only minor floodi curred near the roads, and flows were carr existing channels. Overflow at Colusa reached a peak flow of about 40,000 cfs on ry 20; overflow at this weir caused most flooding within the lower part of Butte Ba peak stage of 57.5 ft was recorded in Butte opposite Colusa Bypass. Two floods, one January and the second at the end of caused overflow to Butte Basin during th water year. Peak overflow along Ord Ferry was about 70,000 cfs on January 17 and was 38,000 cfs on March 31. About half the ov from these floods returned to the main chan fore reaching Afton Boulevard. Peak flows Afton Boulevard, State Highway 162, and Road, ranged from about 39,000 cfs to 44, on January 18 and from about 21,000 cfs to cfs on April 1. Peak overflows at Moulto were nearly 60,000 cfs during both floods stages in Butte Basin opposite Colusa Bypa 61.3 ft on January 19 and 60.3 ft on A (Woodard-USGS)

MANUAL FOR ESTIMATING CHARACTERISTICS OF NATURAL STREAMS IN COLORADO,
Geological Survey, Denver, Colo.

. F. McCain, and R. D. Jarrett.
Colorado Water Conservation Board, Denver, Technical Manual No 1, 1976. 68 p, 12 fig, 8 tab, 33 ef.

Descriptors: *Flood forecasting, *Natural flow, Streams, *Colorado, *Flow characteristics, Methodology, Flood recurrence interval, Flood lains, Topography, Hydrologic data, Flood requency, Regression analysis, Rainfall-runoff elationships, *Estimating.

his manual contains methods for obtaining flood nformation for the 10-, 50-, 100-, and 500-year oods at sites on natural-flow streams in olorado. The peak-discharge information is ap-icable to a wide variety of studies ranging from pid approximation of flood-prone areas to etailed flood-plain studies based on precise ydraulic field measurements. Conversely, the ood-depth information is applicable only for pid approximation of flood-prone areas or as a neral guide to flood depths for comparative pur-ses. This limited usage of the flood-depth infor-ation results from the difficulty in evaluating eld conditions, such as channel width, and size of uctures, such as bridges and culverts, from ex-ng topographic maps. The methods are scribed and a step-by-step procedure for apply-g the methods is presented with several exam-es. Procedures for transferring the depth infor-ation to topographic maps are also described. her sections contain a discussion of accuracy, alytical development of the methods, and a list flood data for gaging stations. W FROM SMALL WATERSHEDS AD-ENT TO THE STUDY REACH OF THE A RIVER PHREATOPHYTE PROJECT, ZONA,
ogical Survey, Menlo Park, Calif.
. Burkham.
lable from Supt. of Documents, GPO, Wash., 20402, Price $0.55. Professional Paper 655-I, 119 p, 8 fig, 2 plates, 3 tab, 16 ref.

riptors: *Storm runoff, *Streamflow, drologic budget, *Small watersheds, zona, Evapotranspiration, Phreatophytes, rologic data, Flow rates, Peak discharge.
ifiers: *Gila River tributaries(Ariz).

The Gila River in Safford Valley, southeastern Arizona, was the site for a field study of evapotranspiration (Culler and others, 1970). During the period of study, 1963-71, measurements of storm runoff in summer--July through October--from tributaries along a 15-mile reach of the Gila River were required for water budget analyses. Most of the outflow from the 43 tributary basins, which range in size from about 0.1 to 20 square miles resulted from thunderstorms of small areal extent. The mean summer runoff for 1963-71 was about 1,370 acre-ft. The maximum summer runoff was about 3,180 acre-ft in 1967 and the minimum was about 130 acre-ft in 1970. The largest storm outflow was about 970 acre-ft. The largest peak discharge occurring in a tributary stream was 8,000 cubic feet per second (cfs) which came from a 14 square mile watershed. The largest peak discharge per square mile was about 2,300 cfs which resulted from a storm centering on a 0.79 square mile watershed. The tributary watersheds contributed to the project area on an average of less than 13 days per year. (Woodard-USGS)

SOIL SLIPS, DEBRIS FLOWS, AND RAINSTORMS IN THE SANTA MONICA MOUNTAINS AND VICINITY, SOUTHERN CALIFORNIA,
Geological Survey, Reston, Va.
R. H. Campbell.
Available from Supt. of Documents, GPO, Wash., D. C. 20402, Price $1.70. Professional Paper 851, 1975. 51 p, 36 fig, 1 tab, 54 ref.

Descriptors: *Landslides, *Soils, *Storm runoff, *California, Reviews, Evaluation, Topography, Soil properties, Slopes, Hydrologic data, Rainfall, Storms, Aerial photography, Vegetation, Soil moisture, Debris avalanches, Damages.
Identifiers: *Soil slips(Southern Calif), *Santa Monca Mountains(Calif).

On the record of the past decade, debris flows generated by soil slips during rainstorms present a greater risk of death and injury to southern California residents than all other kinds of slope failure combined. Soil slips require a combination of three conditions: (1) A mantle of colluvial soil or a wedge of colluvial ravine fill, on (2) a steep slope, where (3) soil moisture is equal to or greater than the liquid limit of the remolded colluvial soil. The most common range of slope for soil slip that give rise to destructive debris flows is from about 56 degrees to about 27 degrees. Slopes steeper than 56 degrees generally do not have a continuous mantle of colluvium; most commonly they are bare bedrock. The lowest slope on which a soil slip has been reported in coastal California is 15 degrees. With radar weather maps showing the distribution of high-intensity rainfall and slope maps showing the distribution of slopes of the most susceptible steepness, the empirical association may provide a means of recognizing areas where the hazard is greatest at any given time during a storm, and warnings to residents could be more specific and reliable. ON THE JOINT DISTRIBUTION OF THE LARGEST FLOOD AND ITS TIME OF OCCURRENCE,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
V. K. Gupta, L. Duckstein, and R. W. Peebles.
Water Resources Research, Vol. 12, No. 2, p 295-304, April 1976. 2 fig, 1 tab, 10 ref, 3 append. OWRT B-032-ARIZ(25). NSF GK-35915 and GK-35791.

Descriptors: *Flood frequency, *Annual peak discharge, *Flood peak, *Mississippi River, Stochastic processes, Hydrograph analysis, Streamflow, Hydrology, Frequency analysis, Time of concentration, Model studies, Kentucky, Minnesota, *Distribution patterns.
Identifiers: Partial duration series, Distribution function, Exceedance, *Licking River(Ky), *St. Paul(Minn).

In a partial duration series the total number of exceedances as well as the exceedance flows is formalized as a random sequence of random variables. This formalism along with some physically reasonable assumptions leads to a rigorous expression for the joint distribution function of the largest exceedance and its time of occurrence. The deviation provides one way to consider the temporal changes in the occurrence and the magnitudes of individual exceedances due to 'seasonal' influences. This approach is general enough to be applied to any time interval of interest; furthermore, the derived expressions are exact (nonasymptotic). It may thus represent an improvement over an application of Gumbel's classical extreme value theory to flood phenomena, which is based on the premise that a large number of exceedances are available over time intervals of interest and which provides only asymptotic expressions. A MODEL OF TURBULENT DIFFUSION,
Technische Hogeschool, Delft (Netherlands). Dept. of Civil Engineering; and Technische Hogeschool, Delft (Netherlands). Lab. of Fluid Mechanics.
C. Kranenburg.
Report No. 75-2, 1976. 43 p, 5 fig, 19 ref, 2 append.

Descriptors: *Turbulence, *Diffusion, *Hydraulics, *Model studies, *Analytical techniques, Flow characteristics, Velocity, Boundary processes, Mathematics, Equations.
Identifiers: *Homogeneous turbulence, Concentration fluctuations, Nonstationarity, Kinematic problem.

A model of particle diffusion in homogeneous turbulence was derived using an approximation concerning the trajectories of the individual fluid particles. The model equation for the mean concentration was in accordance with some exact results, e.g., those for small and large diffusion times, and Taylor's relationship. In the case of a normal velocity distribution, it predicted an almost normal distribution of the mean concentration at all diffusion times. The model was applied also to the concentration fluctuation problem. The resulting equation supported assumptions for large diffusion times found in the literature. The possible application of the model to diffusion in non-homogenous turbulence was touched upon briefly. (Singh - ISWS)

Identifiers: *Tracer measurements, *Flood magnitude, Linearity, Nonlinearity, Flood timing.

LIBRARY OF THE U. S. GEOLOGICAL SURVEY

Flood runoff was traced from seven injection points to the outlet of a 96-acre watershed. Each radioactivity time record at the outlet provided a hydrograph of outflow of the labeled drop of water. The results yielded direct information on the flood process of a type and accuracy not possible from conventional analysis of rainfall and runoff records. The relationship of travel time and average velocity with discharge were examined together with the variations of these relationships over the watershed. Average travel times were shown to be similar to the watershed lag. The nature of the nonlinearity of the flood runoff process was demonstrated. Although the process was grossly nonlinear at low flows, linearity was approximated at high flows. Spatial variations of travel time and hydrograph shape were shown to make contributions to nonlinearity that were additional to the lumped dependence on flood magnitude that is normally considered. The tracing was carried out on the 96-acre Research Creek watershed near Sydney, Australia, by using the radioisotopes gold 198 and chromium 51-EDTA as tracers. The average stream and surface slopes were 7% and 10%, respectively. (Roberts-ISWS)

TIME OF CONCENTRATION OF OVERLAND FLOW,
Nevada Univ., Reno. Center for Water Resources; and Nevada Univ., Reno. Desert Research Inst.
V. L. Gupta, and P. J. Sinclair.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY4, p 549-553, April 1976. 1 fig, 6 ref, 1 append. OWRT A-057-NEV(3).

Descriptors: *Overland flow, *Time of concentration, *Runoff, Flood flow, Land, Flow rates, Streamflow, Hydrologic cycle, Travel time, Urban drainage, Turbulent flow, Surface runoff, Velocity, Equations, Precipitation excess, Watersheds(Basins).
Identifiers: Surface roughness.

The overland flow phase of the runoff process is considered. Working equations were developed for estimating the time of concentration of overland flow in terms of rainfall excess intensity, length of flow path, Manning's roughness coefficient, and average surface slope. Flow continuity and a turbulent flow regime were assumed. The relationships developed are usable for turbulent flow regime in rural areas as well, in contrast to existing computational aids which are applicable only to restricted urban drainage situations. 2F. Groundwater

SPRING FLOW FROM PRE-PENNSYLVANIA ROCKS IN THE SOUTHWESTERN PART OF THE NAVAJO INDIAN RESERVATION, ARIZONA,
Geological Survey, Cheyenne, Wyo.
M. E. Cooley.
Available from Sup. of Documents, GPO, Wash. D. C. 20402 Price $1.05. Professional Paper 521-F, 1976. 15 p, 3 fig, 2 plates, 3 tab, 30 ref.

Descriptors: *Spring waters, *Indian reservations, *Arizona, *New Mexico, *Utah, Groundwater resources, Aquifer characteristics, Hydrogeology, Water quality, Rivers, Inflow, Hydrologic data
Identifiers: *Navajo Indian Reservation(Ariz), Pre-Pennsylvania rocks.

About 220 cubic feet per second (cfs) of spring flow issues from the pre-Pennsylvania rocks in the canyon of the Little Colorado River; the flow is mainly from the Redwall and Muav Limestones, which combine hydraulically to form a multiple-aquifer system. Blue Spring--the largest spring in the Colorado Plateaus physiographic province--discharges about 90 cfs from the left bank of the Little Colorado River. Blue Spring and other nearby springs maintain the perennial flow of the Little Colorado. At the present time, the use of Blue Spring and the other nearby springs for water supplies is not feasible because of (1) the poor chemical quality of the water--more than 2,000 parts per million (ppm) of dissolved solids--and (2) the amount of lift that would be required--about 2,000 feet from the channel of the Little Colorado River to the canyon rim. Water from Vaseys Paradise Spring, in Marble Canyon, contains 163 ppm of dissolved solids; the spring receives its recharge from the Kaibab Plateau, which is only a short distance from Vaseys Paradise. THE AGE OF GROUNDWATER IN THE CHALK OF THE LONDON BASIN,
Atomic Energy Research Establishment, Harwell (England).
D. B. Smith, R. A. Downing, R. A. Monkhouse, I. Otlet, and F. J. Pearson
Water Resources Research, Vol. 12, No. 3, p 394-404, June 1976. 7 fig, 4 tab, 16 ref. U.S. Army 10790-EN.

Descriptors: *Radioactive dating, *Groundwater, *Groundwater basins, *Carbon radioisotopes, Groundwater movement, Pleistocene epoch, Stable isotopes, Radioisotopes, Tritium, Oxygen isotopes, Deuterium, Groundwater recharge, Sampling, On-site investigations, Bicarbonates, Carbonates, Ion exchange, Reduction(Chemical), *Age, *Dating, *Radioactive dating.
Identifiers: *London Basin(England), *Chalk aquifer, Sulfate reduction, Nitrate reduction.

Isotope techniques have been applied to a study of groundwater movement in the Chalk of the London Basin. The 'age' of the water as determined by C14 measurements increases toward the central confined part of the basin where it exceeds 25,000 years and therefore originated during the Pleistocene. The age distribution supports previous interpretations of the permeability pattern partly based on hydrochemistry. Measurements of tritium and the stable isotope ratios of carbon, oxygen, and deuterium were also made. The C13/C12 ratio varied from -13% at outcrop to values less negative than -1% in the central part of the basin which is approaching the value of plus 2.35% for the aquifer matrix. The 018 and deuterium ratios indicate that the Pleistocene waters were recharged at a mean air temperature less than 8°C cooler than that of present day recharge, probably because recharge in the Pleistocene was limited to summer periods because of frozen ground in the winter. HYDROLOGICAL STUDIES OF THE SAGINAW FORMATION IN THE LANSING, MICHIGAN AREA - 1962,
Michigan State Univ., East Lansing. Dept. of Geology.
A. Firouzian.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-242 [illegible] $4.00 in paper copy, $3.00 in microfiche. Technical Report No. 9, December 1970. 29 p, 10 fig, 5 tab, ref.

Descriptors: *Aquifers, *Piezometric, *Potentiometric level, *Michigan, Water table, Groundwater, Groundwater movement, Flow, Pumping, Drawdown, Recharge, Natural recharge, Precipitation(Atmospheric), Rivers, Hydrologic aspects, Geology, Bedrock, Geologic formations, Transmissivity, Hydrology.
Identifiers: *Saginaw formation(Mich), Lansing(Mich), *Grand River(Mich).

The purpose of this investigation was to study the hydrological characteristics of the Saginaw Formation in the Lansing, Michigan area. The water bearing beds of sandstone in the Saginaw Formation are the principal source of water for the greater Lansing area, including the cities of Lansing and East Lansing, Michigan State University, industrial plants, and surrounding townships. The Saginaw Formation is the bedrock formation in the area and is overlain by Pleistocene gla

leposits. The average transmissibility of the Saginaw Formation as determined by flow net nalysis on the basis of 1962 piezometric map is 3,000 gallons per day per foot. The study showed hat the aquifer is recharged from the Grand River t the rate of 3 million gallons per day. The average echarge from precipitation into the aquifer is esti- nated at 4.8 inches per year which is equivalent to 8 million gallons per day based on the recharge rea of an estimated 120 square miles. The amount f water discharged by pumpage is balanced by the mount of water recharged into the area. The cone f depression should remain static if pumpage con- nues at the same rate. (Sims-ISWS)

ethod of identifying an aquifer (groundwater) em was presented. The identification problem formulated within a static optimization ework with least-squares error norm as the ctive function. The system model consists of a bolic two-dimensional partial differential tion, with transmissivity as the model's unk- n distributed parameter. The transmissivity assumed to be a polynomial function of areal ibution over the aquifer, where the polynomi- efficients are to be estimated. An alternate tion implicit numerical technique for solving nonlinear parabolic partial differential equa- with irregular boundaries was utilized. The ification problem was solved by using uardt's nonlinear estimation algorithm. A study was undertaken for the aquifer system ayton, Ohio, and computational results ob- d from the model were compared with results an analog simulation model. (Visocky-ISWS) 11957

Identifiers: *Soil air movement, Imbibition, Boundary conditions, Saturation profile, Relative permeability, Wetting front, Soil infiltration capacity.

A methodology, based on the knowledge of the characteristic curves of the soil, was presented to predict the infiltration rate into a soil, the evolution of the water content in the soil, and the evolution of the water table under natural hydrological boundary conditions. Comparison with experimental results showed the method to be accurate. Infiltration rate curves were obtained for a number of situations involving different boundary and/or initial conditions. The results confirmed the known experimental facts and the field observations that soil-air behavior is an important factor in infiltration phenomena. (Visocky-ISWS)

THE INFLUENCE OF SOIL WATER CONTENT ON THE UPTAKE OF IONS BY ROOTS: II. CHLORIDE UPTAKE AND CONCENTRATION GRADIENTS IN SOIL,
Nottingham Univ. (England). School of Agriculture.
R. J. Dunham, and P. H. Nye.
J Appl Ecol. 11(2), p 581-595, 1974.

Descriptors: *Chlorides, *Absorption, *Soil water, *Ions, Roots, Model studies, *Onions.
Identifiers: Concentration gradients.

Uptake and concentration gradients of Cl in soil in the vicinity of a plane of onion roots were measured at a range of soil water contents. Uptake was greater at higher water contents, and the zones of depletion in the soil spread further from the roots. A relatively simple theoretical model of ion transport to roots accounted for the trends among the measured concentration gradients - including an accumulation of Cl at the root surface in 1 case where transpiration was comparatively high. A more detailed model which took account of the water content changes observed during the uptake period satisfactorily reproduced the general shape of the measured gradients, but tended to underestimate the spread of the depletion zones. A possible reason for this was that hydrodynamic dispersion by the water flux to the roots increased the effective diffusion coefficient of Cl thus increased the spread. Although, ideally, the root absorbing power used in the model should have been continuously adjusted to take into account Cl concentration and matric potential changes at the root surface, the values which gave the concentration gradients that fitted most closely to the measured gradients, agreed well with the root absorbing powers calculated from the measured uptake. At higher soil water contents these values of the root absorbing power also agreed with those obtained for onion seedlings growing in stirred nutrient solution. At lower soil water contents, however, when the matric potential at the root surface fell to about - 25 bar, the root absorbing power was lower (approximately x 0.2) than that for nutrient solution.--Copyright 1975, Biological Abstracts, Inc. Descriptors: *Infiltration, *Infiltration rates, *Mathematical studies, *Air, *Simulation analysis, Equations, Groundwater, Groundwater movement, Soil water movement, Unsaturated flow, Compressibility, Compressible flow, Capillary action, Zone of aeration.
Identifiers: *Cumulative infiltration, Time function, Two-phased flow, Air pressure.

There are several mechanisms by which air affects the infiltration process. In a previous article (See W75-01126) only the viscous resistance to simultaneous flow of water and air was considered. In addition there are other effects: the compression effect, the buoyancy effect, the counterflow effect, the hysteresis effect, and several others. Even though all these effects occur, simultaneously, it is convenient to treat them at first separately and progressively in partial combinations. In this article the compression effect and then the compression and counterflow effects were added to the viscous resistance effect. Formulae for cumulative infiltration versus time were derived. Without the counterflow effect, the functional form of the equation is similar to that of Green and Ampt with two additional correction terms, one for the total viscous resistance effect and one for the compression effect. With counterflow the derived formula no longer has the Green and Ampt functional form. The derived formula remains quite simple. (Morris-ISWS)

Identifiers: Gametogenesis, Helobdella-Stagnalis, *Leeches, *Utah Lake(Utah).

The reproductive biology of the glossiphoniid leech H. stagnalis in Utah Lake, Utah(USA), was studied for an 18-mo. period from June 1970-Dec. 1971. In this lake the overwintering adult leeches produce 2 broods of young in May and June. Evidence is presented to support the idea that the same individual can produce 2 broods. Two complete cycles of gametogenesis also take place. Continuous water temperatures were recorded at the study site to correlate with reproductive activity. Gametogenesis appears to be temperature dependent with the 1st generation of sperm taking 4 mo. to be produced in the fall and winter months while the 2nd generation of sperm is produced in 6 wk during the spring. Egg production follows a similar pattern.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: International cooperation, Boun water levels.

Neither Canada nor the United States attach importance to the International Joint Commi (IJC), judging by the size of staffs and a budgets. The Commission has been restricted relatively minor number of functions in the Lakes-St Lawrence Basin. It has investigated degree and causes of water and air quality d oration; the effects of hydroelectric and na tion projects on water levels; the impacts of w level fluctuations; and the feasibility of a waterway from the St. Lawrence to the Hu River. Projects approved by the Commission produced less than might be expected throu fault of the Commission. The Great Lakes Fi Commission has promoted little internat management. Budgetary limitations restri lamprey control program; institutional limita restrict its ability to deal effectively with fi problems. Commission responsibilities are li to coordination and advisory functions. Canada and the United States have not cho refer most aspects of river basin manageme international bodies, an institutional void ex the Great Lakes Basin to consider these que on a continuous basis. There is a need fo panded international cooperation. (Bell-Corn

2J. Erosion and Sedimentation

A FICKIAN ANALYSIS OF LAKE SEDIMENT UPSURGE,
Arkansas Univ., Fayetteville. Dept. of Chemical Engineering.
L. Thibodeaux, and C. K. Cheng.
Water Resources Bulletin, Vol. 12, No. 2, p 221-236, April 1976. 6 fig, 4 tab, 10 ref. OWRT A-026-ARK(2).

Descriptors: *Lake sediments, *Thermal stratification, *Epilimnion, *Nutrients, *Model studies, Sediment-water interfaces, Eutrophication, Sediment distribution, Analytical techniques, Turbulence, Seasonal.
Identifiers: *Sediment upsurge, *Fickian type models, Equinoxes.

During the period between the vernal and autumnal equinox, the net heat transfer into the lake is positive, and lake stratification occurs with a stable water column consisting of warm water above and cold water below. Some lakes experience reverse stratification in winter but in March the lake is usually at uniform conditions with respect to temperature and chemical species concentration. The stratified-mixed states which occur annually in lakes play a dominant role in the movement of nutrient-rich material from the lake bottom upward into the water column. The semi-infinite slab energy model to represent the lake surface temperature, thermal profile, and thermocline position was extended to include a Fickian type model for the upsurge of nutrients from the sediment-water interface upward. Relations were developed for the rate of nutrient upwelling into the epilimnion and the photoactive zone of a lake. A lake time constant was developed from the model equations. This constant is considered important for predicting the likelihood of a fall algal bloom. Results on model verification attempts on three lakes were presented. (Singh-ISWS)

THE USE OF MULTIPLE REGRESSION MODELS IN PREDICTING SEDIMENT YIELD,
Arizona Univ., Tuscon. Dept. of Management.
J. E. Weber, M. M. Fogel, and L. Duckstein.
Water Resources Bulletin, Vol. 12, No. 1, p 1-17, February 1976. 9 fig, 4 tab, 9 ref. OWRT B-043-ARIZ(2)and B-032-ARIZ(24).

Descriptors: *Sediment yield, *Regression analysis, *Model studies, *Watershed management, *Analytical techniques, Design, Erosion, Particle size, Soil types, Statistics.
Identifiers: *Model choice, Multiple linear regression, Data transformation.

Four commonly used models for predicting sediment yield were analyzed and compared using previously published data. Three of these models involved logarithmic transformations. Some of the problems involved in transforming data were discussed in the context of logarithmic transformations. The test data pertained to 39 watersheds in 11 western states, varying in size from a few acres to more than 50 square miles. Slope erosion is the only major sediment source in these watersheds. Standard regressions using the four models and test data illustrated the problems that may be caused by transformations. The standard regression analysis and the economic loss function analysis indicated that a linear model is preferable for predicting sediment yields. If any transformation is made to satisfy the normality assumptions of linear regression analysis, it should be determined from the distribution of the sample residuals. (Singh-ISWS)

THE LAKE TEXCOCO (MEXICO) SEDIMENTS AND THEIR CAPACITY TO SUPPORT VEGETATION, (IN FRENCH),
Toulouse-3 Univ. (France).
J. C. Revel, V. Ojeda, and J. Rivera.
Bull Assoc Fr Etude Sol. 3, p 193-200, 1974.

Descriptors: *Lakes, *Mexico, *Lake sediments, *Vegetation, *Salts, Gels, Leaching, Salinity, Dehydration, Permeability, Alkalinity, Drying.
Identifiers: *Lake Texcoco(Mexico).

The drying of Lake Texcoco left bare stretches of impermeable, saline and alkaline sediments, unsuitable for any kind of vegetation. The properties of the salt sediments ('jaboncillo') are due to a gel, liable to irreversible dehydration, making the sediments permeable and prone to leaching.--Copyright 1975, Biological Abstracts, Inc.

TEMPORAL CHANGES IN THE OFFSHORE ISLANDS OF MISSISSIPPI,
Mississippi Univ., University. Dept. of Geology and Geological Engineering.
T. H. Waller, and L. P. Malbrough.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-257 150, $5.50 in paper copy, $3.00 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Completion Report, July 1976. 109 p, 32 fig, 49 ref, 3 append. OWRT A-098-MISS(1).

Descriptors: Beaches, Erosion, *Deposition(Sediments), *Mississippi, Gulf of Mexico, *Barrier islands, *Temporal distribution,

*Beach erosion, *Shores, Sediments, Cycles, Tropical cyclones.
Identifiers: Sea level changes.

Historical monitoring of Mississippi's barrier islands (Petit Bois, Horn, Ship, Cat) records the nature and magnitude of changes in position of the shoreline and provides insight into the factors affecting those changes. Documentation of long-term changes from available records involved repetitive sequential mapping of shoreline positions using vintage coastal topographic charts and aerial photographs. Long-term trend or direction of shoreline changes averaged over the 124-year time period (1848 to 1973) indicate that maximum net rates of accretion (16 to 125 feet per year) were recorded on the western ends of Petit Bois, Horn, and Ship islands and North Point of Cat Island. Maximum net erosion (44 to 322 feet per year) dominated the eastern ends of Petit Bois, Horn, and Ship islands and South Spit of Cat Island. Net loss of land during the 124-year time period amounted to 1800 acres or over 18 percent of the land area in 1848. The major factors affecting shoreline changes are deficit in sediment supply, high frequency impact of tropical cyclones, and sea-level changes. Comparison of shorelines indicates definite short-term cycles of erosion related to storms (primarily hurricanes) and partial recovery during intervening years of low storm incidence.

Water Resources Research, Vol 12, No. 1, p 65-70, February 1976. 8 fig, 12 ref. OWRT C-5224(4214)(3).

Descriptors: *Saline water intrusion, *Aquifers, *Florida, *Model studies, *Mathematical models, Groundwater, Sea water, Subsurface waters, Interfaces, Saline water-freshwater interfaces, Rainfall, Pumping, Coasts, Water table, Water levels, Water quality.
Identifiers: *Biscayne aquifer(Fla).

The Galerkin-finite element method can be used to simulate the two-dimensional movement of the saltwater front in the Cutler area of the Biscayne aquifer near Miami, Florida. The concentration distributions for steady state and transient conditions can be obtained by using pressure head data mesured in the field for formulating boundary conditions. The numerical results were found to be in satisfactory agreement with the experimental data. Discrepancies observed in the central part of the aquifer between field and computed values were thought to indicate the presence of a higher-permeability region. (Sims-ISWS)

water-to-brackish marsh near Slidell, Loui- was studied to demonstrate the use of ly sensed data from an airborne multispec-nner and computer processing technique ntifying and classifying vegetational cover rmine areas that are potential breeding sites salt marsh mosquito, Aedes sollicitans. ting ground investigations were performed to locate areas of uniform plant species plant communities for use as calibration sites, or 'training fields,' in the computer analysis. The spectral signatures of these training fields provided the basis for computer decisions on the classification of vegetational complexes in the total study area. Later ground studies indicated a high degree of accuracy in the overall classification. The computer programs used for processing the data were developed at the Purdue University Laboratory for Application of Remote Sensing and modified for this study. In the CLASSIFY program, the digital table look-up method was found to be the fastest and the most economical. (Sims - ISWS)

Reprinted from The Coast and Shelf of the Beaufort Sea, The Arctic Institute of North America, Arlington, Virginia, p 513-540, 1974. ONR N00014-69-A-0211-0003.

Descriptors: *Arctic, *Rivers, *Deltas, *Alaska, Permafrost, Cold regions, Estuaries, Oceans, Floods, Floodwater, Saline water-freshwater interfaces, Flow, Streamflow, Salinity, Ice, Tundra, Sediments, Suspended solids, Sedimentation, Drainage, Hydrology.
Identifiers: *Colville River(Alaska), *Beaufort Sea(Alaska).

Rivers which originate within the zone of continuous permafrost virtually cease flow during winter so that for a period of several months no fresh water or sediment is transported to the ocean. The Colville River in northern Alaska, which is of this type, was studied to determine the nature of the interactions between river and ocean during breakup. By the end of winter the subaqueous portion of the delta consists of a band of snow-covered bottomfast ice which extends seaward to about 2-m depth, a 2- to 3-m ice cover seaward of the bottomfast ice, hypersaline water in unfrozen pockets in the zone of bottomfast ice, and sea water of normal salinity seaward thereof. Spring floodwaters first flush the winter sea water from the delta channels and then flow seaward both over and under the sea ice. Water moving over the sea ice eventually drains through cracks in the ice, but only after much sediment has been deposited. The floodwater beneath the ice advances seaward as a wedge and maintains a sharp interface with the sea water beneath. Although little mixing occurs across the interface during flooding, some suspended material nonetheless settles through to the bottom. Intense flooding normally lasts less than 2 weeks after which the relatively warm fresh water gradually mixes with the cold marine water to create the brackish water system that prevails throughout the summer. (Sims-ISWS)

RIVERBANK FORMS OF THE COLVILLE RIVER DELTA,
Aberdeen Univ., (Scotland), Dept. of Geography.
W. Ritchie, and H. J. Walker.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A009 550, $3.50 in paper copy, $3.00 in microfiche. Technical Report No. 187, June 1975. 18 p, 12 fig, 2 tab, 2 ref. Reprinted from The Coast and Shelf of the Beaufort Sea, The Arctic Institute of North America, Arlington, Virginia, p 545-562, 1974. ONR N00014-69-A-0211-0003.

Descriptors: *Arctic, *Rivers, *Deltas, *Alaska, Permafrost, Cold regions, Banks, Erosion, Bank erosion, Sediments, Suspended solids, Sedimentation, Ice, Tundra, Geomorphology, Hydrology.
Identifiers: *Colville River(Alaska).

The Colville River delta, about 600 sq km in area, has a number of distributaries which empty into the Beaufort Sea across a 45-km front. Distributary banks are composed of a variety of matrials, including peats, gravels, sands, and finer sediments. In addition, because the delta is in the zone of continuous permafrost, banks are frozen and contain several ice forms, including ice wedges. Of the nine types of banks identified, four are erosional, four depositional, and one neutral. The ratio of erosional to depositional banks is about 12:7, with right-hand banks being 72% erosional and left-hand banks 46% erosional. Depositional forms include large-scale river bars and point bars. Low river stages during summer render these bars analogous to beaches, and a sequence of dunes have formed along most riverbanks with a northeast exposure. Thermal erosion and thermal melting are responsible for the development of niches near the base of the banks and for digitate troughs leading back from the river along ice wedges. Bank collapse and block slumping are common, and large amounts of deltaic sediment are contributed to the river and transported seaward. The specific morphologic characteristics of erosional banks vary with bank materials, river stage, current velocity and aspect. (Sims - ISWS)

BULK DENSITY-WATER CONTENT RELATIONSHIP IN MARINE SILTS AND CLAYS,
Lehigh Univ., Bethlehem, Pa.
A. F. Richards, T. J. Hirst, and J. M. Parks.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A012 047, $3.50 in paper copy, $3.00 in microfiche. Journal of Sedimentary Petrology, Vol. 44, No. 4, p 1004-1009, December 1974. 4 fig, 33 ref. ONR N00014-67-A-0370-0005, NOAA 1-35357 and NG-2-72.

Descriptors: *Sediments, *Oceans, *Silts, *Clays, Bulk density, Moisture content, Bottom sediments, Measurement, Laboratory tests, Regression analysis, Equations, On-site investigations, Cores, Sedimentation.
Identifiers: *Marine sediments.

Bulk density and water content were defined and then related to one another and to void ratio by 7 polynomial regression equations based on 1680 measured bulk density and water content values of water-saturated sediments from the Atlantic and Pacific Oceans and other areas. Theoretical relationships between bulk density, water content, and void ratio for specific gravities between 2.30 and 2.85 were demonstrated. The average specific gravity of 2.72 found for the data presented compared favorably to similar values reported in the literature. Use can be made of the regression equations to compute e log p bar sedimentation-compression curves entirely determined from the bulk density of water-saturated sediment measured nondestructively by laboratory or in situ nuclear transmission densitometers. In an example showing the consolidation of a fine-grained calcareous sediment from the Exuma Sound, Bahamas, the all-nuclear laboratory method compared favorably with the conventional, non-nuclear method of constructing e log p bar curves. The combination of suitable regression equations and the all-nuclear method is equally applicable to other fine-grained water-saturated sediments. (Sims - ISWS)

TURBULENT ENTRAINMENT AT THE DENSITY INTERFACE OF A TWO-LAYER STABLY STRATIFIED FLUID SYSTEM,
Johns Hopkins Univ., Baltimore, Md., Dept. of Earth and Planetary Science.
L. H. Kantha.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-016 607, $6.75 in paper copy, $3.00 in microfiche, Technical Report 75-1, August 1975. 162 p, 77 fig, 3 tab, 35 ref, 5 append. ONR N00014-75-C-0700, NSF DES72-01549-A02.

Descriptors: *Turbulent boundary layers, *Entrainment, *Mixing, Density, Turbulence, Shear, Laboratory tests, Salinity, Interfaces, Saline water-freshwater interfaces, Equipment, Model studies, Hydraulic models, Lakes, Oceans.
Identifiers: *Turbulent entrainment.

This report deals with the turbulent entrainment at the density interface of a stable two-layer stratified fluid, resulting from the application and maintenance of a constant shear stress at the top of the upper layer. The investigation is the continuation of the experiments reported earlier by Kato and Phillips (see W70-0183). It was found that the entrainment rate (defined as the ratio of the entrainment velocity to the friction velocity) is a general function of the interface Richardson number (Ri) and is not restricted to a power law with a unique index over the Richardson number range investigated (30-1100). The function can, however, be approximately fitted by a power law Ri to the (-n) power over limited ranges of Ri, but then the index n depends on the Ri range and is a monotonic function of Ri. The results seem to resolve the existing controversy on whether the entrainment should follow the Ri to the (-1) or (-3/2) power law. Furthermore, the entrainment rates observed were considerably higher than those obtained by Kato and Phillips. (Sims-ISWS)

OFFSHORE BARS ALONG THE ALASK ARCTIC COAST,
Louisiana State Univ., Baton Rouge. Coastal S dies Inst.
A. D. Short.
Available from the National Technical Infor tion Service, Springfield, Va 22161 as ADA- 035, $3.50 in paper copy, $3.00 in microfic Technical Report No. 183, June 1975 13 p, 14 2 tab, 13 ref. Reprinted from Journal of Geolo Vol. 83, p 209-221, 1975. ONR N00014-69-A-02 0005.

Descriptors: *Sand bars, *Coasts, *Arctic Oce *Alaska, Waves(Water), Ocean wa Geomorphology, Beaches, Shores, Aerial pho raphy, On-site investigations, Bathymetry, T dra, Sands, Cold regions.
Identifiers: *Offshore bars, Bar migration.

Well-developed offshore bars along the 1,355- long Alaskan Arctic coast possess three distinc forms: (1) multiple parallel bars containing in and outer bar systems; (2) long, parallel bars curring in series but attached to the shore at t updrift ends; and (3) shorter en echelon bars tached to the shore. Some short en echelon are migrating to the west at a rate of 70 m/yr moving sediment on the order of 400,000 cu m Bars attached to the beaches generate pronoun shoreline rhythms consisting of horns and b with amplitudes up to 200 m and lengths of 4-5 Low beach-ridge and swale systems are prese on the horns and destroyed in the bays. The b where the beach is narrowest, tend to coin with locations of inlets or erosion of the tu hinterland. Field evidence strongly indicated variation in bar forms is related to the angl dominant wave approach to the shore; bars ten be shorter and more transverse to the shore w waves arrive at large angles, and longer and r parallel to the shore where waves arrive n parallel to the shore. criptors: *Sediment transport, *Beaches, gineering structures, *Prototypes, *Models es, Groines(structures).
tifiers: *Equilibrium beach profiles, *Wave n.

redictive model, based on both model and otype data, is developed to enable the compu- n of the offshore sediment transport on sandy hes under wave action, as well as of the cor- onding time-dependent and eventual equilibri- each profiles. The offshore transport taking in the D-profile (the real developing profile) e subject of this report. The time-dependent on of the backshore and growth of the transi- rea only serve as boundary conditions for the ss in the D-profile. An analysis is made of the al mechanism, in order to lead to a sche- ation, which is as close as possible to the ac- physical process. The schematization is ed out more thoroughly and derived in its form. The area of applicability of the theory rived and correlated to the available model rototype data. The bed material in all tests for evaluation was sand, the median particle ters ranged between 011 mm and 0.227 mm. e number of tests in which onshore transport red is negligible, only tests in which offshore ort occurred were used in this study. The were processed according to the developed atization and the results are presented and ated. The steps that are to be followed in the ation of the method are summarized. (Sinha S)

National Physical Research Lab., Pretoria (South Africa).
H. R. Watling, and R. J. Watling.
Marine Pollution Bulletin, Vol. 7(3): 1976, p. 45-48, 4 tab., 2 fig., 12 ref.

Descriptors: Water pollution effects, *Metals, *Oysters, *Zinc, *Cadmium, *Copper, *Iron, Manganese, *Nickel, Silver, Pathology(Animal), Aquatic animals, Trace elements, Benthos, Estuarine environment, Africa.
Identifiers: *Trace-metal pollution, *Crassostrea, *Ostrea, Tissue content, Metal content, *Knysna estuary(South Africa).

A preliminary survey of seven trace metals in three species of oyster from the Knysna estuary, South Africa, has been carried out. The results indicate that this area is as yet unpolluted; the data provide baseline levels against which future trace-metal pollution can be measured. Two species of oyster are being grown at a number of sites as part of a long-term program to monitor trace-metal levels in the estuary. (Katz)

U.S. Patent No. 3,958,424, 3 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1509, May 25, 1976.

Descriptors: *Patents, Groundwater, *Groundwater resources, *Water supply, *Moisture availability, Runoff, Capillary flow, Capillary action, Water storage, Water resources development, Irrigation, *Water sources, *Water yield improvement.
Identifiers: Lifting groundwater.

Moisture in cultivated fields, orchards is largely dissipated by absorption into the earth and/or evaporation. A great amount of rainfall is lost due to the fact that during any substantial rainfall, the soil soon becomes saturated and subsequent rainfall is lost by runoff. Therefore, it is the primary object of this invention to provide new and improved methods and apparatus for lifting and retaining ground water in agricultural and other environments. Specifically the invention comprises a planar horizontal flat supporting base of brick, sand, concrete or tile normally embedded below ground level providing support for a lifting and storing unit consisting of one or more vertically oriented webs of glass or the like formed in a spiral of equidistantly closely spaced adjacent convolutions. Adjacent convolutions are closely spaced together so that the capillary effect between adjacent faces of the convolutions serves to lift water upward between the convolutions to a height above its normal level determined by the spacing of the convolutions and the material from which they are formed. The inner extent of the lifting and storing unit consists of a central core cylinder and the outer extent consists of a peripheral cylinder coaxial with the core cylinder with the spiral web or webs extending between the outer surface of the central core cylinder and the inner surface of the outer peripheral cylinder. The spiral web or webs can be of a number of desired materials having a low wetting angle such as glass, ceramic material or the like. (Sinha - OEIS)

PROJECT SKYWATER, A PROGRAM OF RESEARCH IN PRECIPITATION MANAGEMENT, VOLUME I OF II (DRAFT ENVIRONMENTAL STATEMENT).
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
Report INT DES 76-10, Volume I, March 5, 1976. 271 p, 40 fig, 39 tab.

Descriptors: *Weather modification, *Cloud seeding, *Water resources, *Environmental effects, Cloud physics, Water resources development, Rainfall, Snowfall, Precipitation(Atmospheric), Water management(Applied), Water supply, Clouds, Mountains, Agriculture, Projects, Meteorology.
Identifiers: *Environmental impact statements.

Project Skywater is a research cloud seeding effort designed to remove scientific uncertainties and develop the technology required to make cloud seeding a scientifically sound and socially acceptable water resources management tool. The field seeding experiments have been conducted thus far at selected sites in the Western States. Supporting studies are conducted throughout the nation, but mostly in the West. Field experiments are conducted in the mountains during the winter and in the plains during the summer. The primary impact of the program's research activities are insignificant, believed to be a slight but unidentifiable increase in plant growth and stream discharge. If the technology anticipated to be developed from the program is applied continuously over wide areas, the impact would be significant in increased agricultural plant growth and in increased streamflow from mountainous regions. The incidence of avalanche occurrence probably would be increased. Research to date has failed to identify adverse impacts related to seeding agents or significant adverse effects related to managed precipitation. Alternatives considered were termination of project, expansion of conventional water resources engineering, exploitation of groundwater resources, interbasin diversion, desalinization, reuse of degraded water, and land management for increased water yield. (See also W76-11869) (Sims-ISWS)

ERSTATE WATER COMPACTS AND ERAL DEVELOPMENT,
e, Picotte and Pauly, Helena, Mont.
ble.

Rocky Mountain Mineral Law Institute, Vol 21, p 777-800 (1975). 24 p, 66 ref.

Descriptors: *Water resources, *Energy, *Energy conversion, *Interstate compacts, *Coal mines, Rivers, State governments, Coordination, Legislation, Water sources, Water law, Water levels, Water utilization, Water yield, Mineral industry, Water demand, Colorado.
Identifiers: *Yellowstone River Compact.

The increasing energy shortage has brought into focus the need to exploit our coal reserves in Montana, Wyoming, North Dakota and South Dakota. Whether gasification or liquifaction is used to change coal into gas or petroleum, large-amounts of water will be needed to make either process work. The Yellowstone River Compact supposedly is equal to the task of judiciously appropriating water for energy needs in this region. However, after examination of this and other water compacts, the author concludes that they are, by and large, hopelessly outdated to meet water demands of mineral development. Overall, any pronounced effort to appropriate large amounts of water will result in extensive letigation and a re-negotiation of the Yellowstone Compact. (Frank-Florida)

R. S. Schulz, and T. A. Austin.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY1, Proceedings Paper 11843, p 15-28, January 1976. 14 fig, 2 tab, 12 ref. OWRT A-048-IA (5).

Descriptors: *Agriculture, *Stock water, *Water demand, *Iowa, Livestock, Water utilization, Design criteria, Regional development, Water supply, Air temperature, Rural areas, Farms, Correlation analysis.

Recently there has been an increase in the number of regional water supply systems in the Midwest. These systems often serve large livestock populations in addition to the domestic needs within the region. Peak use periods in a rural water supply system with large livestock populations are longer than those seen in high density residential areas. The increased length of peak use can be attributed to livestock feeding operations, but it is not possible to distinguish between the domestic and livestock influences at any particular time. Peak rates of use were found to occur between 7 a.m. and 11 a.m. and 4:30 p.m. and 8:30 p.m. The nomographs indicating daily livestock water consumption developed from data collected in the literature appeared to give reasonable predictions of livestock water requirements based on animal weight and average temperature (Sims-ISWS)

PIVOT SPRINKLER,
H. R. Farris, and C. J. Johnson.
U.S. Patent No. 3,957,204, 8 p, 13 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1093, May 18, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficiency, Water conveyance, Water distribution(Applied), Application equipment.
Identifiers: *Pivot sprinkler.

A pivot sprinkler incorporates an elongate irrigation pipe having a number of sprinklers for irrigating a land area. The pipe is supported by spaced supporting towers each of which is provided with supporting wheels and a drive mechanism. One end of the pipe is rotatably supported from and connected to a standpipe. Controls are provided for retaining the support towers generally in aligned conditions with the elongate pipe extending through the rotational center and forming rotational support for a drive wheel on each of the towers. Each wheeled unit includes a smaller trailing wheel oriented to the rear of the drive wheel and connected to the irrigation pipe by a frame structure for transmitting driving torque exerted by the drive wheel to the ground surface and stabilizing the wheeled unit. Spray nozzles are mounted so that they will discharge water to the rear of the machine leaving the wheel traction area relatively dry. (Sinha - OEIS)
W76-11829

SPRINKLER,
R. B. Costa.
U.S. Patent No. 3,957,205, 7 p, 9 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1093, May 18, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficiency, Irrigation operation and maintenance, Application equipment.

A sprinkler head is fixed to a tubular spindle which is rotatably journaled in and spring biased upward relative to a bearing sleeve, and has improved upper and lower seals for sealing the clearance space between the spindle and bearing sleeve against the entrance of water, dirt, grit and the like. The upper seal includes a seal ring which is retained by the spring in sealing force on the sprinkler head and has a depending annular flexible sealing lip surrounding and engaging a circumferential sealing surface on the bearing sleeve in such a way that if the spindle presses downward through the bearing sleeve against spring action, the seal ring wipes or scrapes dirt and grit from the sealing surface to prevent jamming of the seal ring during the upward spring return of the spindle. The lower seal, which serves also as a spindle thrust bearing, is particularly useful on a water actuated impulse sprinkler and includes a carbon-graphite

seal ring cushioned between resilient seal rings for providing the friction necessary for proper operation of the water actuated impulse driving means of the sprinkler. (Sinha - OEIS)

WATER DISCHARGE DEVICE FOR USE WITH IRRIGATION SYSTEMS,
Hitachi Chemical Co. Ltd., Tokyo (Japan). (Assignee).
S. Watanabe.
U.S. Patent No. 3,958,761, 5 p, 5 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1624, May 25, 1976.

Descriptors: *Patents, *Irrigation, *Surface irrigation, *Irrigation systems, *Irrigation practices, *Irrigation efficiency, Water distribution(Applied), Application equipment, Water pressure, Fertilization, Discharge(Water).

A water discharge device for use with irrigation systems comprises a tubular element formed with female threads at the inside surface and a screw element formed with male threads at the outside surface. The male threads are adapted to engage with the female threads so that the height of the female threads is different from that of the male threads. Since the height of the female threads is different from that of the male threads, a helical clearance is left between the engaging threads providing a pressure reducing passage for the water supplied at a relatively high pressure to be moderately discharged. The fluctuations of the flow rate due to deformations of the elements of the water discharge device under application of a fluctuating hydraulic pressure are avoided. The pressure reduction through the helical passage can be easily controlled by adjusting the depth of engagement between the tubular element and the screw element by turning one relative to the other. EFFECT OF COAL MULCH ON CROP YIELDS,
Agricultural Research Service, Cheyenne, Wyo.
M. L. Fairbourn.
Agron J. 66(6), p 785-789, 1974.

Descriptors: *Crop production, *Mulching, *Coal, Colorado, Soil water, Soil temperation, *Evaporation control, Porosity.

A study was conducted at Fort Collins, Colorado to determine if a mulch of 1.0 to 3.0 -cm diameter coal pieces would reduce evaporation of soil water and increase soil temperature. Treatments of coal mulch and bare soil were used in both laboratory and field experiments to determine not only the effects on soil water and soil temperature, but also soil fertility and light regime for plants. The coal pieces broke down rapidly and became intergrated with the surface soil. The experimental methods showed that the coal mulch effects on soil fertility and light regime were negligible. However, the mulch increased soil water storage compared with a bare soil. The response appeared to be due to a change in soil porosity of the surface, wetting depth and soil cracking. Increased soil temperature seemed to be the dominant factor that caused a prominent plant response from a coal mulch. Plants on the coal mulch plots became established rapidly, grew vigorously, and matured early which resulted in higher yields than those from a bare soil treatment. The experiment indicated that low grade coals, soft coals, or coal-soil mixtures can be used to increase production from agricultural and horticultural plants.--Copyright 1975, Biological Abstracts, Inc.

A LAND USE AND LAND COVER CLASSIFICATION SYSTEM FOR USE WITH REMOTE SENSOR DATA,
Geological Survey, Reston, Va.
J. R. Anderson, E. E. Hardy, J. T. Roach, and R. E. Witmer.
Available from Supt. of Documents, GPO, Wash D. C. 20402 price $0.75. Professional Paper 96 1976. 28 p, 4 fig, 4 tab, 46 ref

Descriptors: *Land classification, *Land us *Remote sensing, Federal government, Sta governments, Data collections, Aerial photo raphy, Aircraft, Satellites(Artificial), Lan development, Urbanization, Agriculture, Forest Wetlands, Tundra, Water, Ranges, Arid land Snow, Ice
Identifiers: *Land cover classification

The framework of a national land use and la cover classification system is presented for u with remote sensor data. The classification syste has been developed to meet the needs of Fede and State agencies for an up-to-date overview land use and land cover throughout the count that will be receptive to data from satellite and a craft remote sensors. The proposed system us the features of existing widely used classificati systems that are amenable to data derived fr remote sensing sources. It is intentionally f open-ended so that Federal, regional, State, a local agencies can have flexibility in develop more detailed land use classification. Revision the land use classification system as presented U. S. Geological Survey Circular 671 was u dertaken in order to incorporate the results of tensive testing and review of the categorizat and definitions. (Woodard-USGS)

SEEPAGE STUDY OF THE ROCKY POI CANAL AND THE GREY MOUNTA PLEASANT VALLEY CANAL SYSTE DUCHESNE COUNTY, UTAH,
Geological Survey, Salt Lake City, Utah.
R. W. Cruff, and J. W. Hood.
Utah Department of Natural Resources, Salt La City, Technical Publication No 50, 1976. 53 p fig, 4 plates, 5 tab, 3 ref.

Descriptors: *Canal seepage, *Water loss, *R systems, Hydrology, *Utah, Data collecti Stage-discharge relations, Hydrologic data.
Identifiers: Duchesne County(Utah), Rocky P canal system, Grey Mountain-Pleasant Va canal system.

A study of the gains or losses of the Rocky P Canal System and the Grey Mountain-Plea Valley canal system, Duchesne County, Utah, made to aid in the water allocation of the c systems. Four sets of seepage runs were m along each of the canals from May 1972 to 1973. Adjustments for fluctuations in flow in canals were made from information obtained water-stage recorders operated at selected tions along the canal during the time of seepage run and from a time-of-travel s Although significant gains and losses were f for specific reaches of the canals, the net los the Rocky Point Canal system, which is 96,8 in length, amounted to 3.4 cubic feet per se (cfs) or about 6 percent of the capacity o canal. The net loss for the Grey Mountain-Ple Valley Canal system, which is 160,300 ft in le was 24.5 cfs or about 8 percent of the c capacity. Qualitative evaluation of the geohyd gy of the study area indicates an estimated r of canal loss to the river system of about 2 cent, or 5.6 cfs. (Woodard-USGS)

L. Duckstein.
In: Symposium on the Hydrologic Systems Aspects of Water Resources Planning - Water Resources Problems - Hydrologic Analysis in Perspective, Fall annual meeting of the American Geophysical Union, December, 1974, San Francisco, California, 20 p. 1 fig, 34 ref, append. OWRT B-043-ARIZ(3).

Descriptors: *Planning, *Coordination, *Data collections, *Model studies, *Decision making, Water resources development, River basin development, Evaluation, Input-output analysis, Systems analysis, Operations research, Performance, Resources.

Water resources development usually requires at least 3 groups of people: one group gathers data, one conceives models, and the third makes decisions. Ideally, these 3 groups should work together, but it often happens that they work in a compartmentalized manner. This paper presents a 4-step methodology for problem definition which leads to a logical interconnection between decisions, models, and data. Step 1 defines input-output; the input set consists of elements such as rainfall, floods, pollution, etc., while output involves elements that can be controlled, such as power production or water quantity or quality. In step 2, performance variables, indices, and ordering are defined. Step 3 examines resource indices and ordering for design implementation; the type and quantity of resources to be utilized by a given system are evaluated. The fourth step is designed for the case when conflicts arise between ordering (or performance ranking) of two different systems, which leads to a trade-off ordering. The fifth step is a test plan describing how a system will be evaluated in space and time. (Robinett-Arizona)

FLOOD CONTROL DESIGN WITH LIMITED DATA - A COMPARISON OF THE CLASSICAL AND BAYESIAN APPROACHES,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
E. F. Wood.
In: Design of Water Resources Projects with Inadequate Data, Vol. 1, Proceedings of the Madrid Symposium, June 1973; Unesco - WMO - IAHS, Unesco - OMM - AISH, 1974, p 469-483. 2 fig, 1 tab, 19 ref. OWRT C-4118(9021)(13).

Descriptors: *Flood control, *Design, *Probability, Water resources, Planning, Decision making, Hydrology, Economics, Rivers, Streamflow, Methodology, Costs, Damages, Equations, Mathematical models, Systems analysis.
Identifiers: *Bayesian analysis, Classical approach, Limited data.

Water resource planners usually design flood control structures by choosing an extreme value model. The model's parameters are estimated from the available streamflow data and design decisions are made by finding the discharge related to a particular level of risk. In most design problems, the data on extreme events is severely limited, making parameter estimation difficult. Two different parameter estimation approaches are investigated--classical and Bayesian--which are applied to a flood design problem for a northeastern U.S. river. The classical approach uses the maximum liklihood criterion for parameter estimation. The Bayesian approach is performed for objective prior information based upon observations from other rivers and for subjective prior information derived by considering the effect of river basin development upon flood discharges. The results indicate that the classical and Bayesian approaches lead to different design discharges for the same level of risk. (Bell-COrnell)

RESERVOIR EFFECTS ON PROPERTY VALUES ACCORDING TO LOCATION AND RURAL VS. URBAN USE,
Kentucky State Univ., Frankfort. School of Public Affairs.
C. M. Vaughan, and D. M. Soule.
Water Resources Bulletin, Vol. 11, No. 6, p 1103-1106, December 1975. 2 tab, 5 ref. OWRT A-006-KY(15).

Descriptors: *Reservoirs, Effects, *Water resources development, *Economic impact, *Property values, Market value, Lakes, Flooding, *Kentucky.
Identifiers: Urban, Rural, Covariance analysis, Analysis of variance, Lake Cumberland(Kentucky).

Economic impact of water resources development may be hidden by improper grouping of relevant data, as demonstrated in two studies of real property value changes in the same reservoir area and similar time periods. Using market values for the period 1955-65, changes in total value of real property in a 12-county group in the Lake Cumberland, Kentucky area were not significantly different from value changes in five other 12-county groups selected without reference to water resource development. But significant differences were discovered in the period 1950-64 with smaller groups of counties studied according to rural or urban property and location relative to the lake. Covariance analysis of annual property values regressed on time showed that, for rural property, greatest value increases were in the shoreline group, whereas for urban property, greatest value increases were in the shoreline group, whereas for urban property, greatest value increases were in the flood-protected group. These two studies are briefly described and their results are interpreted. (Bell-Cornell)

PRACTICAL APPLICATIONS OF SPACE SYSTEMS.
National Research Council, Washington, D. C. Space Applications Board.
National Academy of Sciences, Washington, D. C., 1975. 67 p, 2 append. NASA NSR 09-012-016.

Descriptors: *Remote sensing, *Satellites(Artificial), Weather, Climates, Land use, Planning, Agriculture, Forests, Ranges, Surface waters, Lakes, Water resources, Natural resources, Oceans, Water quality, Communication.
Identifiers: *Space Shuttle system.

In November 1973, the National Aeronautics and Space Administration (NASA) asked the National Academy of Engineering to conduct a summer study of future applications of space systems, with particular emphasis on practical approaches, taking into consideration socioeconomic benefits. In December 1973, the Academy agreed to perform the study and assigned the task to the Space Applications Board (SAB). A representative group of users and potential users conducted an intensive two-week study to define user needs that might be met by information or services derived from earth-orbiting satellites. This work was done in July 1974 at Snowmass, Colorado. Subsequently, the SAB reviewed the work of this group, evaluated its findings, and prepared this report, which presents the SAB's own conclusions and recommendations. For the study, user-oriented panels were formed, comprised of present or potential public and private users, including businessmen, state and local government officials, resource managers, and other decision-makers. A number of scientists and technologists also participated, functioning essentially as expert consultants. The conclusions of the study were founded on the resulting statements of needs, as expressed by the user community, in light of considerations of practicability provided by space technologists. The study was designed to provide an opportunity for knowledgeable and experienced users, expert in their fields, to express their needs for information or services which might (or might not) be met by space systems, and to relate the present and potential capabilities of space systems to their needs. PRACTICAL APPLICATIONS OF SPACE SYSTEMS, SUPPORTING PAPER 5, INLAND WATER RESOURCES.
National Research Council, Washington, D. C. Panel on Inland Water Resources.
National Academy of Sciences, Washington, D. C., 1975. 77 p, 3 tab, 21 ref, 3 append. NASA NSR 09-012-106.

Descriptors: *Remote sensing, *Satellites(Artificial), *Lakes, *Surface waters, Rivers, Bodies of water, Estuaries, Mapping, Planning, Water resources, Surveys, Floods, Soil moisture, Turbidity, Water pollution, Suspended solids, Snow, Ice, Ice cover, Snow cover, Groundwater resources, Salinity, Runoff.
Identifiers: *Inland waters.

In November 1973, the National Aeronautics and Space Administration (NASA) asked the National Academy of Engineering to conduct a summer study of future applications of space systems, with particular emphasis on practical approaches, taking into consideration socioeconomic benefits. In December 1973, the Academy agreed to perform the study and assigned the task to the Space Applications Board (SAB). For the study, nine user-oriented panels were formed, comprised of present or potential public and private users, including businessmen, state and local government officials, resource managers, and other decision-makers. A number of scientists and technologists also participated, functioning essentially as expert consultants. The primary objective of the Panel on Inland Water Resources was established as determining how and to what extent space technology can be used in the timely development and improved management of the nation's inland water resources. The term 'space technology' refers to a system or systems which may include satellites, high-altitude aircraft, and ground installations with attendant sensors that remotely measure various parameters and collect ground-based data and relay them via satellite to processing centers. Emphasis has been placed on user applications which the panel believes will arise within the next decade. (See also W76-11756) (Sims - ISWS)

PRACTICAL APPLICATIONS OF SPACE SYSTEMS, SUPPORTING PAPER 6, EXTRACTABLE RESOURCES.
National Research Council, Washington, D. C. Panel on Extractable Resources.
National Academy of Sciences, Washington, D. C., 1975. 22 p, 2 fig. NASA NSR 09-012-106.

Descriptors: *Remote sensing, *Satellites(Artificial), *Natural resources, *Land resources, Industries, Mineral industry, Mining, Fuels, Fossil fuels, Coals, Oil, Earth materials, Construction materials, Surveys, Mapping, Geology, Geologic mapping.
Identifiers: *Extractive resources, Extractive industries.

In November 1973, the National Aeronautics and Space Administration (NASA) asked the National Academy of Engineering to conduct a summer study of future applications of space systems, with particular emphasis on practical approaches, taking into consideration socioeconomic benefits. In December 1973, the Academy agreed to perform the study and assigned the task to the Space Applications Board (SAB). For the study, nine user-oriented panels were formed, comprised of present or potential public and private users, including businessmen, state and local government officials, resource managers, and other decision-makers. A number of scientists and technologists also participated, functioning essentially as expert consultants. The Panel on Extractable Resources was charged with reviewing the use of information from space systems in the operation of the extractive industries, particularly in exploration for mineral and fuel resources. The conclusions and recommendations presented were based on the premise that the survival of modern industrial society requires a continuing, secure flow of resources for energy, construction and manufacturing, and for use as plant foods. Discovery of the volumes and qualities of the great variety of earth resources needed to sustain this flow will tax the scientific and engineering ingenuity of industry and government. Data from space systems will provide an important addition to information generated from aircraft-mounted sensors and ground field studies. (See also W76-11756) (Sims - ISWS)
W76-11759

PRACTICAL APPLICATIONS OF SPACE SYSTEMS, SUPPORTING PAPER 7, ENVIRONMENTAL QUALITY.
National Research Council, Washington, D. C. Panel on Environmental Quality.
National Academy of Sciences, Washington, D. C., 1975. 56 p, 1 fig, 9 tab, 3 append. NASA NSR 09-012-106.

Descriptors: *Remote sensing, *Satellites(Artificial), *Environment, Environmental control, Water quality, Air pollution, Water pollution, Industries, Pollutants, Turbidity, Coasts, Oceans, Wetlands, Land use, Public health, Measurement, Sampling, Surveys, Costs, Cost-benefit analysis.

In November 1973, the National Aeronautics and Space Administration (NASA) asked the National Academy of Engineering to conduct a summer study of future applications of space systems, with particular emphasis on practical approaches, taking into consideration socioeconomic benefits. In December 1973, the Academy agreed to perform the study and assigned the task to the Space Applications Board (SAB). For the study, nine user-oriented panels were formed, comprised of present or potential public and private users, including businessmen, state and local government officials, resource managers, and other decision-makers. A number of scientists and technologists also participated, functioning essentially as expert consultants. The Panel on Environmental Quality concerned itself with the potential use of space systems to assist in determining the current state of air, water, and land environments and in monitoring them for the effects of man's activities. The panel elected to narrow its considerations to ways in which space systems might be used to determine: (1) what pollutants are introduced into the major environmental media, (2) what effects of these pollutants are manifested, and (3) the effectiveness of abatement and control actions. Environmental aspects were discussed in relation to: (1) air quality, (2) water quality, (3) land quality as related to land use, and (4) public health. (See also W76-11756) (Sims - ISWS)

WATER RESOURCES AND THEIR DEVELOPMENT IN NIGERIA,
Ibadan Univ. (Nigeria), Dept. of Geography.
J. O. Ayoade.
Hydrological Sciences Bulletin, Vol. 20, No. 4, 581-591, December 1975. 6 fig, 2 tab, 12 ref.

Descriptors: Water resources, *Subsurface waters, *Surface waters, *Groundwater, *Africa, *Groundwater resources, *Hydrogeology, *Water resources development, Hydrology, Drought, Hydrologic cycle, Geology, Evapotranspiration, Seasonal.
Identifiers: *Nigeria, *Thornthwaite's formula.

A preliminary assessment is given of Nigeria's surface and underground water resources. It discussed the relevant meteorological, hydrological and hydrogeological factors which determine the magnitude and spatial pattern of the distribution of these resources. It was pointed out that the present uncoordinated and piecemeal development of Nigeria's water resources stems from the of a national water policy and an adequate institutional framework for managing these resources. Two solutions were suggested. One is that the Federal Government should as a matter of urgency establish a National Water Resources B

charged with rational planning, management and development of the country's water resources. The other is that a training program should be established to produce the necessary skilled manpower in the field of water resources. (Terstriep - ISWS)

entifiers: *Manoa Valley watershed(HI), hu(HI).

noa Stream drains the Manoa Valley watershed ated near the central part of the Honolulu tropolitan area. Past studies have characterized streamflow, sediment, and water quality of noa Stream. However, the two existing stream-w gaging stations on the stream are located near head of the valley and none in the downstream tion. Hence, there is no good way to correlate discharge at these gages with the discharge in downstream sections of the stream. In this ly, a permanent stream gaging station was blished at a downstream location on the versity of Hawaii campus. The development, rumentation, method of operation, and main-nce of this gaging station are reported. Data ined from this new University of Hawaii-noa Stream Gaging Station will allow meaning-measurements of streamflow and water quality racteristics of Manoa Stream.

SYSTEMS APPROACH FOR THE PLANNING AND MANAGEMENT OF THE MORAVA RIVER BASIN, YUGOSLAVIA,
California Univ., Los Angeles. Dept. of Civil Engineering.
J. A. Dracup, and A. D. Feldman.
Working Paper No. 62, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 20 p, 3 fig, 3 tab, 4 ref. (United Nations, Department of Economic and Social Affairs).

Descriptors: *Water resources development, *Comprehensive planning, *Computer models, *Project planning, *River basins, Simulation analysis, Optimization, Mathematical models, Systems analysis, Decision making, Feasibility, Hydrologic aspects.
Identifiers: *Morava River basin(Yugoslavia).

The development of a comprehensive master plan for a large-scale water resource system is enhanced by the use of computer based mathematical models for system simulation and optimization. The ultimate use of these hydraulic, hydrologic and water quality models is the formulation of decision and control strategies for the development of an on-line data management and control system for the entire basin. Presented is a case study of the Morava River basin, Yugoslavia, one of several ongoing studies of the Morava by a number of local, federal and international agencies. The Morava River currently requires viable development schemes to alleviate problems of flooding, sedimentation, water supply and water quality. A system description is given, and project objectives and the project plan are discussed. Presented is a comprehensive table of the origin and purpose of models for the Morava River basin; 22 models are considered. Finally, the paper discusses accomplishments to date, including data management, model development and application, and decision and control strategies. (Bell-Cornell)

APPROPRIATION BY THE STATE OF MINIMUM FLOWS IN NEW MEXICO STREAMS,
J. B. Draper.
Natural Resources Journal, Vol 15, p 809-822 (October 1975). 14 p, 70 ref.

Descriptors: *Water allocation(Policy), *New Mexico, *Streams, *Appropriation, *State jurisdiction, Constitutional law, Water law, Water rights, Water resources, Legal aspects, Legal review, Conservation, Headwaters, Wildlife, Prior appropriation, Legislation, State governments.

There are alternatives to prior appropriation, especially where protection of instream values is required. First, the state could withdraw waters from eligibility for appropriation. In New Mexico, a pure appropriation state, this would require a constitutional amendment; but the state engineer could deny new applications and restrict changes in use that reduce return flows. Second, the best method is for the state itself to appropriate waters for instream protection. Legislation should be enacted that would state minimum flows necessary to sustain the riparian habitat and other comparable recreation uses. This method has no constitutional bar to its application. Third, any person, club, or agency could appropriate instream flows, with the beneficial use requirement satisfied by the existence of a recreational purpose. (Frank-Florida)
W76-11899

MINIMUM STREAMFLOW-FEDERAL POWER TO SECURE,
D. A. Grady.
Natural Resources Journal, Vol 15, p 799-807 (October 1975). 9 p, 74 ref.

Descriptors: *Water resources development, *Protection, *Federal jurisdiction, *Headwaters, *Appropriation, Judicial decisions, Water law, Legal aspects, Water resources, Conservation, Wildlife, Wildlife conservation, Navigable waters, Constitutional law, Water rights, Water allocation(Policy), Federal government.

Developers have been appropriating waters recently even up to the headwaters of streams. The result has been a diminution of flow and damage to surrounding wildlife. The federal government has, therefore, been asserting prior rights to instream flows to protect wildlife. Two methods have been used. First, courts have recognized that there is a federal pre-emptive right to all water necessary to fulfill federal land purposes. Headwaters can be protected as being necessary for the support of national forests and parks. Second, the broad federal navigational power can be used as a means to require minimum streamflow. There must only be an incidental navigational purpose for courts to find effective water rights to be lodged in the federal government. (Frank-Florida)

BIOLOGICAL CONTROL OF WATER WEEDS WITH PLANT PATHOGENS,
Florida Univ., Gainesville. Dept. of Plant Pathology.
T. E. Freeman, R. Charudattan, K. E. Conway, F. W. Zettler, and R. D. Martyn.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-257 172, $4.00 in paper copy, $3.00 in microfiche. Florida Water Resources Research Center, Gainesville, Publication No. 36, June 1976. 39 p, 2 plates, 4 tab, 42 ref. OWRT A-027-FLA(10). 14-34-0001-6010.

Descriptors: *Biocontrol, *Plant pathology, *Aquatic weed control, *Pathogenic fungi, Rusts, Aquatic insects, Water hyacinth, Biomass, Plant diseases, *Florida.
Identifiers: *Cercospora rodmanii, Rhizoctonia solani, Acremonium zonatum, Uredeo eichhorniae, Bipolaris stenospila, Water hyacinth rust, *Rodman Reservoir(Fla).

Both endemic and exotic plant pathogens were evaluated as biological control agents for water weeds. Additional studies investigated the potential use of an integrated program of biological control using plant pathogens and insects. Of the endemic pathogens tested, Rhizoctonia solani, Acremonium zonatum and Cercospora rodmanii exhibited potential as biocontrols. The latter fungus was the most promising. In fact, C. rodmanii

was established as the causal agent of a decline disease which effectively controlled waterhyacinths in Rodman Reservoir in two out of the last five years. It has the additional advantage of being highly host specific for waterhyacinths. The two exotic pathogens showing the most potential were the waterhyacinth rust, Uredeo eichhorniae and Bipolaris stenospila. Results of the integrated control studies showed that the action of a combination of pathogens and insects would significantly reduce biomass accumulation in waterhyacinth populations. WATER ALLOCATION IN UTAH--PROTECTION OF INSTREAM USES,
R. A. Kimsey.
Utah Law Review, Vol 1975, p 687-707 (Fall 1975). 21 p, 112 ref.

Descriptors: *Utah, *Appropriation, *Public benefits, *Water shortage, *Water supply, State governments, Legal aspects, Water users, Water utilization, Economic efficiency, Economics, Priorities, Prior appropriation, Riparian rights.

The appropriative water system in Utah has evolved into a market system because water resources are fully appropriated. In Utah, water goes to the most economically profitable user when it does change hands. This emphasis on market value has in the past left instream users empty-handed because their utility in dollar terms was and still is low. This conflict between water for public benefit and water for private economic development is slowly evolving into a balance between the two. The author sees needed legislative changes taking place, but believes they are inadequate in themselves. The judiciary must ensure an equal voice for instream water uses. This can be done most effectively through the public trust doctrine. All competing values could then be considered, not solely the market value of appropriated waterland. (Frank-Florida)

WETLAND'S RELUCTANT CHAMPION: THE CORPS TAKES A FRESH LOOK AT 'NAVIGABLE WATERS',
Lewis and Clark Coll., Portland, Oreg. Northwestern School of Law.
R. W. Haines.
Environmental Law, Vol 6, p 217-241 (Fall 1975). 25 p, 101 ref.

Descriptors: *Federal Water Pollution Control Act, *Navigable waters, *Wetlands, *Federal jurisdiction, *Rivers and Harbors Act, Estuaries, Marshes, Streams, Headwaters, Lakes, Tributaries, Environment, Environmental control, Conservation, Judicial decisions.

With the passage of the Federal Water Pollution Act Amendments of 1972 (FWPCA), the Corps of Engineers received a mandate to supervise a much broader area of 'navigable waters'. This definition was greatly expanded over the previous one in the 1899 Rivers and Harbors Act. The Corps balked at implementing new regulations, but was forced judicially to do so. The new permit system and regulations were implemented only after a fight with the Environmental Protection Agency over greater protection for wetlands. The discharge of dredge and fill is now covered in primary tributaries as well as natural lakes. In addition, by July 1, 1977 the Corps' jurisdiction will be extended up to the headwaters of all streams and tributaries. (Frank-Florida)

WATER MANAGEMENT DURING DROUGHT EVENTS,
Central and Southern Florida Flood Control District, West Palm Beach.
W. V. Storch.
In Depth Report, Vol 2, No 1, p 1-8, April 1974. 8 p, 2 fig.

Descriptors: *Water allocation(Policy), *Droughts, *Florida, Water resources, *Groundwater, Water levels, Water level recorders, *Water management(Applied), Water table, Water supply, Water utilization, Legislation, Aquifers, Water conservation, Water circulation.
Identifiers: *Lake Okeechobee(Fla).

Drought can begin a long time before people feel its effects, since groundwater levels drop before any crisis appears at the surface. Emergency measures with regard to drought should take the form of supply and demand charts, both for surface and groundwater. Once the water manager is satisfied that an emergency is not due to mechanical failure or local circumstances, the only answer is to reduce water usage. Different drought indices are given, as well as a chart showing water supply and demand trends for Lake Okeechobee. (Frank-Florida)

EXAMINATION OF WATER MANAGEMENT ALTERNATIVES IN CONSERVATION AREA 2A.
Central and Southern Florida Flood Control District, West Palm Beach.
In Depth Report, Vol 2, No 3, p 1-12, July-August 1974. 12 p, 5 fig, 4 photo.

Descriptors: *Florida, *Flood plains, *Drawdown, *Ecosystems, *Fishkill, *Wading birds, Detritus, Grasses, Trees, Plant physiology, Plant morphology, Environmental effects, Grasslands, Willow trees, Wildlife, Wildlife habitats, Wildlife conservation, Wildlife management, Drainage effects, Vegetation regrowth, *Water management(Applied)

In 1973 a decision was made to drain Conservation Area 2A in Broward and Palm Beach Counties, Florida. The drawdown was an attempt to reverse some changed ecological conditions in the area and to consolidate compact and dry organic detritus. Studies of the effects of the drawdown indicated that ecological changes would be reversible and that flora and fauna could be restored. When the marsh levels receded thousands of wading birds, mostly ibis and heron, returned. The result was a very successful rookery in a neighboring area. An associated incident of the drawdown, however, was a fishkill caused primarily by the organic detritus and by overcrowding in available waters. Future kills can be avoided by starting drawdowns much sooner and effecting them more slowly. Vegetation changes resulting from the drawdown included the return of maidencane and break-rush to the area, disappearance of wet prairie growth, with little immediate effect on sawgrass or woody plant. Projections anticipate return of woody growth and of wildlife such as deer and kite. (Comer-Florida)

Identifiers: *California Aqueduct.

The California Aqueduct and the engineeri structures comprising the Tehachapi crossing a major elements of the California State Water Pr ject. Other new facilities, which will cost approx mately $2.3 billion, will include power plan aqueduct systems, the highest earthfill dam in t country and mammoth pumping plants. The Pr ject hopefully will assure flood control, cle hydroelectric power, recreational sites and i proved fish and wildlife habitats. The Aqued begins in northern California and transports wa by gravity to various pumping plants. A system computer monitoring and control centers at f major field divisions regulates over 600 miles aqueduct canals. All operations are monitored a coordinated by computer. Some of the setba which have been encountered and which will h to be solved include: animals falling into aqueduct; tumbleweeds clogging up trash rac thereby impeding water flow; valve failures; labor disputes. Descriptors: *Groundwater resources, *Aquifer characteristics, *Hydrologic data, *Water quality, *Well data, Hydrogeology, Groundwater movement, Water yield, Groundwater recharge, Springs, Ephemeral streams, *Utah.
Identifiers: *Pine Valley drainage basin(Utah).

The Pine Valley drainage basin is an area of about 730 sq mi in Millard, Beaver, and Iron Counties in southwestern Utah. Total annual precipitation in the basin averages about 410,000 acre-ft. Less than 500 acre-ft of runoff reaches the playa on the lowest part of the valley floor. There is no surface outflow from the basin. Ground-water recharge from precipitation averages about 21,000 acre-ft annually. However, about 3,000 acre-ft of the recharge moves eastward under the topographic divide into the adjacent Wah Wah Valley drainage basin. Many of the 80 known springs in the basin issue from perched zones in extrusive igneous rocks in the Needle Range. Estimated average annual ground-water discharge is about 21,000 acre-ft--650 acre-ft by springs; 940 acre-ft by seepage to streams; 5,500 acre-ft by evapotranspiration; less than 5 acre-ft by pumping from wells; and 14,000 acre-ft (including about 3,000 acre-ft that goes to the Wah Wah Valley drainage basin) that is assumed to be discharged by subsurface outflow to maintain the natural balance between recharge and discharge. All water sampled in the basin was chemically suitable for most existing uses. A list of about 100 Publications of the Utah Department of Natural Resources, Division of Water Rights, is included. PROBABLE EFFECTS OF INCREASING PUMPAGE FROM THE SCHOFIELD GROUND-WATER BODY, ISLAND OF OAHU, HAWAII,
Geological Survey, Honolulu, Hawaii.
R. H. Dale, and K. J. Takasaki.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-253 752, $4.00 in paper copy, $3.00 in microfiche. Water-Resources Investigations 76-47, May 1976. 45 p, 14 fig, 4 tab, 18 ref.

Descriptors: *Groundwater resources, *Pumping, *Drawdown, *Projections, *Hawaii, Aquifer characteristics, Hydrogeology, Groundwater recharge, Groundwater potential, Water yield, Hydrologic budget, Hydrologic data.
Identifiers: Oahu(Hawaii), *Schofield groundwater body(HI), Increased pumping effects.

The Schofield water body occurs near the geographic center of the island of Oahu, Hawaii. Ground-water dams maintain a head of 85 meters within the body, in contrast with the heads of 7.3 meters or less in the adjacent basal-water bodies. Under present development, pumpage from the Schofield water body is small as compared to the total flux, and most of the ground water flows over or through the adjacent ground-water dams into the adjacent basal-water bodies. Increasing pumpage from the Schofield ground-water body will cause a reduction in head in the Schofield ground-water body, and a decrease in the ground-water flux to the adjacent basal-water bodies. Recharge to the Schofield water body is estimated at 481 thousand cubic meters per day, and pumpage averages 28 thousand cubic meters per day. The difference, 453 thousand cubic meters, flows to the adjacent basal-water bodies. Of the difference, more than 80 percent flows south to the Pearl Harbor basal-water body. (Woodard-USGS)

SIMULATED EFFECTS OF THE PROPOSED NARROWS RESERVOIR ON THE WATER-TABLE AQUIFER ALONG THE SOUTH PLATTE RIVER, MORGAN COUNTY, COLORADO,
Geological Survey, Denver, Colo.
A. W. Burns, and J. B. Weeks.
Open-file report 76-379, May 1976. 15 p, 7 fig, 2 tab, 6 ref.

Descriptors: *Model studies, *Pre-impoundment, *Water table, *Surface-groundwater relationships, Computer models, Forecasting, Methodology, Reservoirs, Dams.
Identifiers: Morgan County(Colo), Narrow reservoir(Colo), *South Platte River(Colo).

A computer model was used to estimate the effects of the proposed Narrows Reservoir on the alluvial aquifer adjacent to the South Platte River near Fort Morgan, Colo. Changes in ground-water discharge to the river caused by the proposed reservoir were estimated assuming steady-state conditions. The proposed reservoir was simulated for two different reservoir pool altitudes. For the conditions simulated, the principal effects of the proposed reservoir on the ground-water system would be an increase in water-table altitude in the aquifer and a redistribution of ground-water discharge to the South Platte River. The change in water level at Fort Morgan was less than 1 foot for the two reservoir conditions simulated. No significant change in the ground-water system would occur downstream from Fort Morgan. Ground-water discharge would decrease by 24 cubic feet per second (cfs) above the proposed dam and increase by 24 cfs below the proposed dam for steady-state conditions with the reservoir pool at 4,404 feet. Ground-water discharge would decrease by 11 cfs above the proposed dam and increase by 15 cfs below the proposed dam for steady-state conditions with the reservoir pool at 4,383 feet. (Woodard-USGS)

Available from the National Technical Information Service, Springfield, Va 22161 as PB-241 532, $3.50 in paper copy, $3.00 in microfiche. Report NYSDOT-ERD-75-RR26, February 1975. 17 p, 7 fig, 3 tab.

Descriptors: *Recharge ponds, *Storm water, *Groundwater recharge, Artificial recharge, Pit recharge, On-site investigations, On-site data collections, Inflow, Storm runoff, Water levels, Highways, Soils, Soil mechanics, Soil properties, Infiltration, Data collections, Data processing, Civil engineering.
Identifiers: *Recharge basin tests.

The results are presented of a full-scale field infiltration test performed on a temporary 150- by 35-ft recharge basin, which was inundated by controlled discharge from a 4.5-million gallon storage tank. The data obtained from the test permitted the verification of a basin design method developed in a previous study. The theory developed in the original study was for a constant-head, suddenly applied case and used a value equal to half the maximum head in determining the infiltration rate. This theory and corresponding assumptions were found to lead to a desirable net safety factor of 1.40, as was originally anticipated. As a result of this work, the Soil Mechanics Bureau of the New York State Department of Transportation is preparing a manual covering both design and environmental considerations in using recharge basins. Groundwater has been a primary source of useable water for thousands of years. In some areas of the world underground reservoirs are perhaps the only means of survival. In the United States, however, groundwater is currently endangered. In areas of Texas and New Mexico thousands of feet of groundwater are removed each year with recharge measurable in inch franctions. In southern California most aquifers are already dry. Besides depleting a non-renewable resource, over pumping can cause serious surface damage through subsidence. If groundwater is properly used, however, it is the safest, cheapest, purest water available. In addition to the quantity, purity of groundwater is also endangered. Methods of surface pollution reduction such as underground fuel pipelines, cesspools and septic tanks, buried radioactive wastes, industrial waste pits, injection wells and sanitary landfills all provide dangerous seepage possibilities into groundwater reserves. Since groundwater pollution is difficult detect until too late, action is needed soon to protect groundwater resources for the future. (Comer-Florida)

WISCONSIN STRIVES TO MINIMIZE CONFLICTS OVER THE USE OF WATER,
P. V. McAvoy.
Marquette Law Review, Vol 59, p 145-168 (1976). 24 p, 80 ref.

Descriptors: *History, *Wisconsin, *Water resources, *Groundwater, *Surface water, Judicial decisions, Legal review, Legal aspects, Water resources, Wells, Withdrawal, Water supply, Water table, Water policy, Water allocation(Policy).

Analyzed here is the Wisconsin Supreme Court's record in dealing with groundwater. Two cases are specifically examined, but the broader context covers the development of over 70 years of water law. The court made the shift from the old commonlaw, or English rule, to the more modern American rule, by overruling one of the state's most basic water law cases. The shift was from having complete freedom to draw underground water to withdrawal for a beneficial use. Now it is also possible to sue one who violates this rule at all; previously, no cause of action existed without a showing of malicious intent. This modern view does not indicate a sudden scarcity of water, but rather an acknowledgment that groundwater movement is scientifically predictable. Proof of damage will now be legally acceptable. MOST JAMAICAN WATER COMES FROM LIMESTONE AQUIFERS,
National Water Authority of Jamaica (Kingston).
G. Shrivastava.
The Johnson Drillers Journal, Vol. 48, No. 3, p 12-13, May-June, 1976. 1 fig.

Descriptors: *Aquifers, *Limestone, *Karst topography, *Water wells, Permeability, Transmissivity, Model studies, Groundwater
Identifiers: *Jamaica, Well testing, Well siting, Drilling costs.

Limestone aquifers are the major source of water in Jamaica and their importance is increasing continuously with the demand for water for domestic, agricultural and industrial purposes. The land surface of the island is nearly entirely underlain by limestone and is permeated by karst topography. Ground water levels are ephemeral in the limestone aquifers. An instance of an annual variation of 240 feet has been observed. A well yield of 2000 gallons per minute with minimum drawdown is not unusual. The flow in the hard limestone aquifers is due to a combination of pipe flow, open channel flow and flow through a porous medium. Consequently, equations of groundwater hydraulics have limited application. Aquifer models have provided more reasonable aquifer perameters for local ground-water basins. Well siting has been a problem in the hard limestone aquifers. Well acidizing is used to improve yield in wells where blocking of fissures by fine particles is a problem. Freezing of groundwater around a well shows promise of increasing well yields. Due to the great depth of groundwater occurrence and high drilling cost of drilling, the search for methods to improve well yields continue. (Heiss-NWWA)

HARRIS-GALVESTON SUBSIDENCE DISTRICT CREATED TO 'END' SUBSIDENCE,
Harris-Galveston Coastal Subsidence District, Houston, Tex.
E. Wagoner.
The Cross Section, Vol. 22, No. 6, p 3-4, June, 1976. 1 fig.

Descriptors: *Land subsidence, *Groundwater, *Water wells, Legislation, Water supply, Hydraulics, Safe yield, Water conservation, Water demand, Surface waters, Well permits, Texas.
Identifiers: *Galveston Coastal Subsidence District.

Land surface subsidence has become a critical problem in some areas of the Texas Gulf Coast area in recent years. During 1974 an average of 2 million gallons of water per day was pumped from an area including all of Galveston county and the eastern half of Harris County. Because of its low elevation, the land in the area of concentrated emphasis is critically affected by subsidence. The Harris-Galveston Coastal Subsidence District was created in 1975 by the 64th Texas Legislature to combat this problem. The plan is to control subsidence within the boundaries of the districts jurisdiction by reduction of ground water withdrawals to amounts which will restore and maintain sufficient artesian pressure to control and prevent subsidence. The District plann recognize surface waters as a viable alternative meeting the increasing water needs of Harris Galveston counties. The three principal sources surface waters available to the area within the District are the Trinity, San Jacinto and Brazos Rivers. A number of water users are using surface water and others are planning to convert to surface water in the future. Additional need of surface water supplies has prompted the construction

Lake Livingston on the Trinity River which will
yield 840 million gallons per day by the end of
1976. Well permits are required for wells already
existing and wells to be drilled. The permits are is-
sued for a term of one to five years. At least once a
year the District makes a complete study of the
ground-water situation to determine water levels,
ates of withdrawal and other information which
nay affect land subsidence within the district.

is article outlines the development and the
tus of the law applicable to groundwater
oblems in Ohio. A summary of the Ohio law and
es dealing with groundwater rights are
esented. Trends, exceptions and critical turning
nts in Ohio groundwater law are noted. Three
es of problem cases are recognized: cases in-
ving interference with groundwater supply;
es involving interference with a surface water
ply through use of groundwater supply; and
es of damage to property through the use of
undwater. In groundwater interference cases
Ohio Supreme Courth has applied the English,
bsolute rule, that groundwater extracted from
's land is part of the freehold and derived from
's ownership of the soil. Even so, some lower
rts have limited the taking of groundwater to
ations where there is no interference with
blished riparian rights and no resulting 'draw
n' of surface streams. Another groundwater
ciple not yet applied in Ohio is that of trespass.
undwater which flows to adjacent lands and
imentally affects its use and value is a
pass. As water becomes more scarce in Ohio,
e will undoubtedly be arguments for the aban-
ment of the strict application of the absolute

Maps, tables and charts indicate aquifer
withdrawal patterns throughout the state of
Florida. This information suggests that, barring
extreme drought or increased waste, there will be
sufficient resources of water for the forseeable fu-
ture in Florida. The geologic nature of several dif-
ferent aquifers are discussed, as well as the inti-
mate connection between surface and subsurface
waters. The relationship between fresh and salt-
water is also explored. The use of electronic
analog models, financed by the Federal Govern-
ment, aid in predicting aquifer reaction to surface
weather conditions. (Frank-Florida)

ships, Natural recharge, Streamflow, Ground-
water mining, Groundwater availability, Surface
water availability, Water utilization.

Improved techniques for locating, measuring and
keeping track of water are being utilized by the
United States Geological Survey. Although sur-
face water supplies are running low, surface water
is only 4% of the potential freshwater supply.
Presently, 20% of the nation's water needs is filled
from underground reservoirs. Unfortunately,
groundwater is usually hard water because of dis-
solved minerals. It may also be contaminated. The
three methods used successfully to purify polluted
groundwater supplies are containment, reduction
of leachate concentration and retrieval wells.
Another problem pertaining to groundwater oc-
curs when the water table is lowered in areas
where the groundwater recharge rate is lower than
the water removal rate. This lowering of the water
table can cause reduced streamflow since half the
water flowing in streams comes from groundwater
rather than surface runoff. Some regions also ex-
perience problems of land subsidence when the
water table is lowered while coastal areas often
suffer from salt water intrusion. (Capehart-
Florida)

4C. Effects On Water Of Man's Non-Water Activities

**APPRAISAL OF THE WATER RESOURCES OF
CHARLOTTE COUNTY, FLORIDA,**
Geological Survey, Tallahassee, Fla.
H. Sutcliffe, Jr.
Florida Bureau of Geology, Tallahassee, Report of
Investigations No 78, 1975. 53 p, 18 fig, 13 tab, 24
ref.

Descriptors: *Groundwater resources, *Aquifer
characteristics, *Water quality, *Water demand,
*Urbanization, Hydrologic data, Water levels,
Water yield, Water utilization, Chemical analysis,
Surface-groundwater relationships, Saline water
intrusion.
Identifiers: Charlotte County(Fla).

The coastal area of Charlotte County, in west-cen-
tral Florida, is undergoing rapid urbanization and
is experiencing major problems in obtaining suffi-
cient water of suitable quality to meet public-
supply requirements. The upper artesian aquifer,
or Zone 1, lies 50 to 150 ft below land surface. This
zone is commonly used as a source for domestic
and small irrigation supplies and provides some
water for public supplies. Zone 2 lies 150 to 250 ft
below land surface and is used extensively by ir-
rigators in eastern Charlotte County. Zone 3 lies
250 to 400 ft below land surface. Many unused ir-
rigation wells tapping this zone are being plugged
by land developers to prevent the movement of
saline water (5000 mg/liter of dissolved solids) into
the upper zones. Zone 4 lies 600 to 800 ft below
land surface and water from this zone is more
saline than water from the upper zones. In the
western half of the county, the shallow aquifer has
been intruded by salt water from the Gulf and the
estuaries and from deeper zones. Large water sup-
plies for Charlotte County will be obtained in the
future chiefly from: (1) the water-table aquifer in
the southeastern part where permeable shell beds
yield as much as 600 gpm of potable water; (2)
Zones 1 and 2 where they have not been con-
taminated by saline water; (3) desalted ground
water; and (4) water imported from outside the
county. (Woodard-USGS)

EVALUATION OF STREAM CHANNELIZATION AND MITIGATION ON THE FISHERY RESOURCES OF THE ST. REGIS RIVER, MONTANA,
Montana Cooperative Fishery Unit, Bozeman.
J. A. Lund.
Fish and Wildlife Service, Washington, D. C., Office of Biological Services, Report FWS/OBS-76-07, June 1976. 49 p, 12 tab, 14 ref, append. FWS 14-16-0008-737.

Descriptors: Streambeds, Channel morphology, *Fish populations, *Road construction, *Railroads, Trout, *Montana, Rivers, Turbidity, Erosion, Water temperature, Water chemistry, Streams.
Identifiers: *Stream channelization, Stream morphology, Mitigating devices(Fish), *St Regis River(Mont).

Stream morphology and gamefish populations of the St. Regis River, Montana were studied during the summers of 1973, 1974 and 1975 to determine the effects of stream channelization caused by highway (Interstate 90 and U. S. 10) and railroad construction. In-stream structures used to mitigate fish losses were also evaluated. Population estimates were made using electrofishing methods on unaltered, altered, altered with mitigating structures, and 'old' altered study sections. Physical parameters of each section were mapped to show differences between altered and unaltered sections. Results show that mitigating structures (jetties and random rock clusters) were effective in providing fish habitat comparable to unaltered sections. Fish populations in new channels usually stabilized in approximately one year. Trout populations in 'old' altered sections with no mitigation failed to recover to unaltered section levels. Due to aesthetic reasons, fishermen preferred unaltered or partially altered sections over altered sections. The number of pools per section as measured by pool-riffle periodicity provided the closest correlation to trout population changes. (FWS)

5A. Identification Of Pollutants

EVALUATION OF PFIZER SELECTIVE ENTEROCOCCUS AND KF MEDIA FOR RECOVERY OF FECAL STREPTOCOCCI FROM WATER BY MEMBRANE FILTRATION,
Ontario Ministry of Health, Toronto(Ontario). Lab. Services Branch.
M. H. Brodsky, and D. A. Schiemann.
Applied and Environmental Microbiology, Vol. 31, No. 5, p 695-699, May, 1976. 3 tab, 16 ref.

Descriptors: *Streptococcus, *Sewage effluents, *Membrane processes, *Analytical techniques, Filters, Microbiology, Bacteria, Microorganisms, Hydrolysis, Evaluation, Performance, Efficiencies, *Pollutant identification.
Identifiers: Enterococci, Membrane filtration.

Pfizer selective enterococcus and KF agars were compared for their recovery of fecal streptococci from sewage effluent on membrane filters. The KF agar recovered significantly greater numbers of organisms but was not as selective as the Pfizer agar. About 83% of the typical colonies were confirmed as fecal streptococci and 54% as enterococci with the KF agar, and more than 90% of all colonies recovered on membrane filters were confirmed as fecal streptococci and 86% as enterococci with the Pfizer agar. The tan color resulting from esculin hydrolysis, which was not always visible on the surfaces of the colonies, was not considered a necessary differential characteristic on the Pfizer agar. The detection of esculin hydrolysis on membrane filters was not improved by using a new Millipore type HC filter. An attempt to improve the selectivity of KF agar while retaining its inclusiveness by incubation at 45 C was not successful. (Kreager-FIRL)

MICROMETHODS FOR THE DETERMINATION OF NONFILTERABLE AND FILTERABLE RESIDUES,
Environmental Protection Agency, Chicago, Ill. Central Regional Lab.
M. J. Carter, M. Huston, and O. J. Logsdon II.
Journal Water Pollution Control Federation, Vol. 48, No. 4, p 652-659, April, 1976. 5 tab, 23 ref.

Descriptors: *Gravimetric analysis, *Pollutant identification, *Analytical techniques, Evaluation, Filters, Equipment, Measurement, Filtration, Membrane processes.
Identifiers: Filterable residues.

Micromethods for the gravimetric analysis of nonfilterable and filterable residues in water samples are described and compared with standard methods. An electronic microbalance equipped with digital display units and a polonium-210 ionizing source to reduce the electrostatic charge on the filters is used for both nonfilterable and filterable determinations. Sample filtration is performed with a Millipore thirty-place membrane sampling manifold using 15- by 125 millimeter culture tubes to receive the filtrate. A comparison of the micromethod for both nonfilterable and filterable residue analysis with the corresponding standard methods reveals no significant differences for a variety of water sample types. The precision of the micromethod for nonfilterable residue analysis is 3 mg/liter below 50-mg/liter nonfilterable residue and 9 mg/liter above 50 mg/liter at the 95% confidence level. The precision of the method for filterable residue analysis is 26 mg/liter at the 95% confidence level. (Kreager-FIRL)
W76-11633

THE USE OF CARBON DIOXIDE IN SAMPLING AND PRESERVING NATURAL LEACHATES,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
N. E. Korte, E. E. Niebla, and W. H. Fuller.
Journal Water Pollution Control Federation, Vol. 48, No. 5, p 959-961, May, 1976. 2 fig, 2 tab, 9 ref.

Descriptors: *Leachate, *Sampling, *Preservation, *Carbon dioxide, *Chemical properties, Landfills, *Pollutant identification, Inorganic compounds, Ions, Chemical reactions.

The use of carbon dioxide for preserving natural leachate samples collected for the purpose of assessing the pollution potential of sanitary landfills was investigated. Two sets of natural leachate obtained from a commercial septic tank were collected, one under carbon dioxide and the other exposed to the atmosphere. For the collection and maintanance of samples under carbon dioxide, the collection vessel was first purged with the gas, and the leachate was added while the effluent was being flushed with carbon dioxide. Leachate collected with carbon dioxide did not show precipitation or changes in pH, color, and dissolved inorganic ion concentration which were associated with leachate samples exposed to the atmosphere. Such changes occurred even as a result of momentary contact of the sample with air, indicating the degree of precaution required to preserve neutral leachates. (Kreager-FIRL)

DETERMINATION OF NITRATE ION AT THE PART PER BILLION LEVEL IN ENVIRONMENTAL SAMPLES WITH A CONTINUOUS FLOW IMMOBILIZED ENZYME REACTION,
Georgia Univ., Athens. Dept. of Chemistry.
D. R. Senn, P. W. Carr, and L. N. Klatt.
Analytical Chemistry, Vol. 48, No. 7, p 954-958, June, 1976. 4 fig, 4 tab, 29 ref.

Descriptors: *Colorimetry, *Enzymes, *Nitrates, Pollutant identification, Analytical techniques, Industrial wastes, Sea water, Effluents, Ions.

An enzymatic procedure for the colorimetric determination of nitrate ion in aqueous samples is described. The mehod is based on the enzymatic reduction of nitrate to nitrite by the radical nitrite of the radical cation of 1,1'-dimethyl-4,4'-bipyridinium dichloride in the presence of the enzyme nitrate reductase. The production of nitrite is monitored by the sulfanilamide N-(1-naphthyl) ethylenediamine dichloride azo dye reaction. A detection limit of 17 ppb is possible using a 1-centimeter cell in a continuous flow analyzer. The detection limit can be increased to about 2 ppb by using a non-flow system since photometer noise is the major limiting factor. Although the procedure utilizes an immobilized enzyme, the method can be adapted for use with soluble enzyme preparations. Analyses of industrial effluent samples revealed good correlation with the accepted copper-cadmium reductor method. The precision of the method is 1% in a continuous flow analyzer at a concentration of 0.2 ppm. The method can also be used for analyzing sea water samples where the nitrate content is typically less than 50 ppb. (Kreager-FIRL)
W76-11636

CONTRIBUTION TO THE STUDY OF STORM WATER IN URBAN ENVIRONMENT
CONTRIBUTION A L'ETUDE DES EAUX DE RUISSELLEMENT EN MILIEU URBAIN),
Joustis, G. Martin, and J. P. Dubreuil.
Techniques et Sciences Municipales--L'Eau, Vol. 71, No. 4, p 179-181, April, 1976. 3 fig, 1 tab, 2 ref.

Descriptors: *Pollutant identification, *Storm water, *Cities, *Drainage water, *Urban drainage, Recreation, Zinc, Copper, Chemical oxygen demand, Lead, Organic compounds, *Storm water, Urban runoff.

A study was made in an urban environment to assess the potential hazards of using drainage water for recreational purposes. Zinc and copper concentrations were low, but significant quantities of lead and hydrocarbons were found. Chemical oxygen demand (COD) is at a maximum after one hour of dry and greater after a long dry spell, but pollution due to storm water remains small. (Snyder-Kreager-FIRL)
W76-11637

EVALUATION OF THE APPLICABILITY OF PYROLYSIS-GAS-LIQUID CHROMATOGRAPHY FOR THE IDENTIFICATION OF MICROORGANISMS IN WATER AND SEWAGE TREATMENT PLANT EFFLUENTS,
National Bureau of Standards, Washington, D. C. Center for Building Technology.
J. Symuleski.
Proceed. 3rd National Conference on Complete Wastewater Reuse, June 27-30, 1976, Cincinnati, Ohio, p 1-11. 2 fig, 1 tab, 29 ref.

Descriptors: *Pollutant identification, *Bacteria, *Waste water treatment, *E. coli, *Chromatography, *Automation, Effluents, Analytical techniques, Coliforms, Microorganisms, Feasibility studies, Evaluation.
Identifiers: *Pyrolysis-gas-liquid chromatography.

A study of pyrolysis-gas-liquid chromatography was performed to determine its feasibility for the automated identification of bacteria in water and waste water treatment effluents. Analysis of chromatograms and integrator tapes from ten runs on Escherichia coli showed a vary high degree of reproducibility, even between samples with weight differences of between 300 and 400 micrograms. The maximum standard deviation in retention time for any one peak occurring early in the trace was plus or minus 0.07 minutes. The highest degree of reproducibility in retention times occurred after peak 16, with the maximum standard deviation being plus or minus 0.04 minutes. The technique appears to have good potential for routine taxonomic work, and the present study indicates that the detection of E. coli can be made at levels that are occasionally encountered in sewage treatment plant effluents. Further work is necessary to determine whether or not the technique is applicable for the analysis of bacteria at concentrations as low as 2-10 colonies/100 ml. (See also W76-11257) (Kreager-FIRL)

A PRELIMINARY EVALUATION OF THE CHEMICAL CHARACTER OF WATER NEAR THE NORTHWEST SHORE OF TOPAZ LAKE, DOUGLAS COUNTY, NEVADA,
Geological Survey, Carson City, Nev.
J. O. Nowlin.
Open-file report 76-419, 1976. 14 p, 5 fig, 1 tab, 3 ref.

Descriptors: *Baseline studies, *Water quality, *Groundwater, *Land development, Septic tanks, Sewage effluents, Data collections, Water analysis, Chemical analysis.
Identifiers: *Topaz Lake area(Nev).

The potential for intensive development of land near Topaz Lake, Douglas County, Nevada, has raised concern regarding the possible effect of septic-tank effluents on the quality of local ground waters and the lake. Analyses of samples from 13 wells, one spring, the lake, and an inflowing creek were examined for trends in chemical composition. Sampled ground waters from sites upgradient in the hydrologic system have higher concentrations of sulfate and dissolved solids than ground waters near the creek and the lake. Preliminary data suggest that the ground-water reservoir in downgradient areas is locally recharged by the creek and perhaps by the lake. (Woodard-USGS)

GROUND-WATER QUALITY AT THE SITE OF A PROPOSED DEEP-WELL INJECTION SYSTEM FOR TREATED WASTEWATER, WEST PALM BEACH, FLORIDA,
Geological Survey, Tallahassee, Fla.
W. A. J. Pitt, Jr., and F. W. Meyer.
Open-file report 76-91, 1976. 43 p, 8 fig, 8 tab, 8 ref.

Descriptors: *Water quality, *Groundwater, *Baseline studies, *Waste disposal wells, *Test wells, Forecasting, Path of pollutants, Sewage treatment, Sewage effluents, Injection wells, Deep wells, Evaluation, Aquifers.
Identifiers: *West Palm Beach(Fla), Pre-well construction data.

The U. S. Geological Survey collected scientific and technical information before, during, and after construction of a deep test well at the location of a future regional waste-water treatment plant to be built for the city of West Palm Beach, Florida. Data from the test well will be used in the design of proposed deep-well injection system for disposal of effluent from the treatment plant. Shallow wells in the vicinity of the drilling site were inventoried and sampled to provide a data base for detecting changes in ground-water quality during construction and later operation of the deep wells. In addition, 16 small-diameter monitor wells, ranging in depth from 10 to 162 feet, were drilled at the test site. During the drilling of the deep test well, water samples were collected weekly from the 16 monitor wells for determination of chloride content and specific conductance. Evidence of small spills of salt water were found in wells raging in depth from 10 to 40 feet. (Woodard-USGS)

DDT PLUS PCB'S IN BLUBBER OF HARBOR SEALS,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
R. E. Anas.
Pestic Monit J. 8(1), p 12-14, 1974.

Descriptors: *DDT, *Polychlorinated biphenyls, *Chlorinated hydrocarbon pesticides, California, Oregon, Washington, Alaska, Columbia River, Islands, Sounds, Sampling, *Pollutant identification.
Identifiers: Phoca-Vitulina-Richardi, *Harbor seals, Seal blubber, Puget Sound(Wash), San Miguel Islands(Calif), Priblof Islaands(Alas).

Samples of blubber from 13 harbor seals (Phoca vitulina richardii) were collected in 1971 from San Miguel Island, Calif. (USA); the Columbia River, Oreg.; Puget Soud, Wash.; and the Pribilof Islands, Alaska. Total amounts of DDT plus PCB's (polychlorinated biphenyls) ranged from 380.7-2350.0 ppm in San Miguel Island seals; 459.4-1620.0 ppm in 2 Puget Sound seals; 27.7-109.9 ppm in 3 Columbia River seals; and 6.8-27.8 pmin 3 Pribilof Island seals. There was no indication of loss of total DDT plus PCBs in 3 samples reanalyzed after 2 yr in frozen storage.--Copyright 1975, Biological Abstracts, Inc.

THE CONCENTRATIONS OF MERCURY, CADMIUM, LEAD AND COPPER IN FISH AND SHELLFISH OF KOREA, (IN KOREAN),
Pusan Fisheries Coll. (Republic of Korea).
J. H. Won.
Bull Korean Fish Soc. 6(1/2), p 1-19, 1973.

Descriptors: *Mercury, *Cadmium, *Lead, *Copper, *Fish, *Shellfish, Asia, Oysters, Crustaceans, *Heavy metals, Pollutant identification, Water pollution effects.
Identifiers: Exoskeleton, *Korea, Octopus, Squid.

Heavy metal concentrations were detected in fish and shellfish sampled from Oct. 1971-April 1972, in Korea. In general, fish viscera, shellfish muscle and crustacean exoskeletons contained high concentrations of the metals. Samples from the W coast contained relatively high concentrations of Hg, Cu, Cd and Pb, but those of the S coast contained high levels of Cd and Pb. The concentrations of Cu in the samples of the W coast were almost twice as much those of the other coasts. Hg concentrations in the samples raged from 0.02-0.58 ppm with an average of 0.16 ppm. Cd concentrations were higher in fish viscera and shellfish than in fish muscle, ranging from less than 0.02-0.78 ppm with an average of 0.12 ppm in the muscle samples. Pb concentrations were slightly higher in the fish viscera. In muscle and bone the range was 0.06-4.84 ppm with an average of about 1 ppm. Cu concentration was very high in the viscera. Shellfish muscle contained almost 4 times as much Cu as fish muscle, particularly cephalopods, i. e., squid and octopus, contained very high levels of Cu, and oysters collected from Gunsan area on the west coast contained the highest levels of Cu. Cu concentrations ranged from 0.12-28.7 ppm with an average of 1.4 ppm in fish muscle and 5.9 ppm in shellfish muscle.--Copyright 1975, Biological Abstracts, Inc.
W76-11729

DETERMINATION OF M-PHENYLENEDIAMINE IN WATER, (IN RUSSIAN),
Vsesoyuznyi Nauchno-Issledovatelskii Institut Gigieni i Toksikologii Pestitsidov, Kiev (USSR).
N. F. Kazarinova, I. S. Dukhovnaya, and L. E. Myannik.
Gig Sanit. 11, p 61-63, 1974.

Descriptors: *Pollutant identification, Water analysis, Analytical techniques, Organic compounds, *Chromatography, *Methodology.
Identifiers: *Epoxy, *Phenylenediamine, Thin layer chromatography.

A method was developed for determining the toxic substance m-phenylenediamine in water based on extraction of the preparation from water with subsequent quantitative determination with TLC. Migration of m-phenylenediamine from epoxy coatings into water simulating food products depended on the relationship of the ingredients in the coating formula, time of exposure and temperature of the model medium.--Copyright 1975, Biological Abstracts, Inc.

USE OF ANIMAL BEHAVIOR STUDIES IN WATER TOXICOLOGY, (IN RUSSIAN),
Akademiya Nauk SSSR, Tolyatti. Institut Biologii Vnutrennykh Vod.
B. A. Flerov.
Gidrobiol Zh. 10(5), p 114-120, 1974.

Descriptors: *Toxicity, Reviews, *Fish behavior, Invertebrates, *Bioindicators, Metabolism, *Pollutant identification, Testing, *Animal behavior.
Identifiers: Literature reviews.

A literature review on the use of investigations of the behavior of fish and invertebrates in water pollution toxicology is presented. The behavior reactions can serve as indices of the effect of sublethal concentrations of toxic substances. Changes in behavior are the initial signs of metabolic disorders and therefore can be used as operative, sensitive tests for toxicity of the pollutants in the water.--Copyright 1975, Biological Abstracts, Inc.

INTERACTION OF BLUE-GREEN ALGAE WITH MULTIPLY-CHARGED INORGANIC CATIONS, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Inst. of Colloidal Chemistry and Water.
V.I. Zhuravleva, L. A. Kul'skii, and E. S. Matskevich.
Gidrobiol Zh. 10(6), p 82-84, 1974.

Descriptors: *Cyanophyta, *Cations, *Kinetics, Biomass, Salts, *Separation techniques, Flotation, *Algae, *Pollutant identification.
Identifiers: Microcystis-Aeruginosa, *Aggregation.

The kinetics of separation of an algal biomass in the presence of salts formed by multiply charged cations (La, Tl, Al, Fe) with application of a direct electric current to the culture of blue-green algae (Microcystis aeruginosa) was studied. The effectiveness of separating the algal mass from the water increases with decreasing pH. The processes of aggregation and flotation (i.e., formation of neuston film) are due to interaction of the cells with the multiply charged cations and not with their hydrolysis products. These phenomena were not observed on applying a direct current to the algae without the addition of the salts of multiply charged cations and an increase of the application time of the current promoted a more energetic aggregation and flotation.--Copyright 1975, Biological Abstracts, Inc.

USE OF MULTISPECTRAL PHOTOGRAPHY IN WATER RESOURCES PLANNING AND MANAGEMENT IN NORTH CAROLINA,
North Carolina State Univ., Raleigh. Dept. of Geosciences.
C. W. Welby.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-257 098, $6.00 in paper copy, $3.00 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Report No. 115, June 1976. 110 p, 32 fig, 7 tab, 14 ref. OWRT A-076-NC, 14-31-0001-4033.

Descriptors: *Aerial photography, *Photogammetry, *Monitoring, *Pollutant identification, Water management(Applied), Photography, Water quality, Planning, *North Carolina, Biomass, Secchi disc, Measurement.
Identifiers: *Multispectral photography, Chowan River(NC).

A series of multispectral aerial photographic missions were flown over the Chowan River of North Carolina to study and evaluate possible uses of multispectral photography in planning for and management of North Carolina's water resources. Flights were also made over parts of the Cape Fear River and Northeast Cape Fear. The report describes how the technique might be used to trace pollutants associated with turbid water and how water draining from the swamps might be traced in larger water bodies. The technique has potential usefulness for monitoring phytoplankton buildups and can be used even if only limited groundtruth is available. Areas of apparently differing water quality were monitored by the multispectral photography both in the Chowan River and in the Northeast Cape Fear River. A technique was developed by which the difference between the extinction depths of a red quadrant and a white quadrant on a modified Secchi disc can be used with water sampling and analysis to obtain biomass concentrations indirectly. This relationship can be one of the groundtruth measurements used to establish relationships between the reflectance characteristics of a water body and various water quality parameters direcly or indirectly. REGIONAL CHARACTERISTICS OF TOTAL DISSOLVED MINERALS IN STREAM WATERS IN ILLINOIS,
Northern Illinois Univ., DeKalb. Dept. of Geology.
R. C. Flemal, and M. M. Nienkerk.
Water Resources Bulletin, Vol. 12, No. 3, p 501-509, June 1976. 2 fig, 4 tab, 10 ref. S-046-ILL.

Descriptors: *Water chemistry, *Chemical analysis, *Illinois, *Dissolved solids, *Natural streams, *Mineralogy, Analytical techniques, Water analysis, Water quality, Water properties, Streams, Rivers, Surface waters, Urban runoff, Sulfates, Carbonates, Geology, Water pollution sources, Regions.
Identifiers: *Dissolved minerals, *Illinois River(Ill), *Fox River(Ill), *Vermilion River(Ill), Environmental quality, Regional characteristics.

Using water analyses from 67 gaging stations, discharge-frequency-weighted mean concentrations and average annual yield per unit area were determined for the total dissolved mineral content of Illinois streams. The resultant data indicate that total dissolved mineral contents are controlled by regional rather than local factors. In most cases plausible explanation for the magnitudes could be found in regional patterns of natural and demographic conditions. Although the data suggest

hat total dissolved minerals are increasing, the elative contributions of natural versus nthropogenic phenomena were difficult to delimit t this level of investigation. (Henley - ISWS)

entifiers: Hubbard Brook Experimental orest(NH).

cessive deposits of atmospheric sulphur ginating from fossil fuel burning has long aracterized the Northeast, especially New En- nd. This study records the extent and con- uences of atmospheric pollution around the bbard Brook Experimental Forest in New mpshire. The rainwater of New England con- ns 3 to 4 milligrams per liter (mg/liter) of sulfate, ereas normal precipitation on a worldwide is, saturated with carbon dioxide, is much less dic. As a result, New England rainwater pH is out 4.1, compared to normal 5.7, and the domi- t anion in the Hubbard Brook streams is sulfate ner than the normally dominant anion bicar- ate. The higher acidity of the Hubbard Brook er would tend to indicate that chemical thering rates of rocks would be higher than mal. The studies indicate, however, that thering reactions in the area are relatively in- plete, possibly because of the maturity of the a soil. The studies also show that cationic denu- on in the Hubbard Brook area is considerably er than normal, thus indicating that carbona- reactions are responsible for denudation. New lies are required to more fully evaluate the lts. (Comer-Florida)

OIL-IN-WATER CONTENT MONITOR DEVELOPMENTAL PROGRAM SUMMARY,
Coast Guard, Washington, D.C. Office of Research and Development.
R. W. Montfort.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A-022 960, $4.00 in paper copy, $3.00 in microfiche. Interim Report No. USCG-D-188-75, December 1975. 39 p, 18 fig, 1 tab, 3 ref.

Descriptors: *Continental Shelf, *Water quality control, *Oil pollution, *Monitoring, *Environmental effects, *Water pollution, *Instrumentation, Oily water, Water pollution sources, Fluorescence.
Identifiers: *Outer Continental Shelf, Bilge water, Light scattering.

Feasibility of three concepts for oil-in-water content monitors developed under separate Coast Guard contracts is described. The three methods - oil fluorescence synchronous scanning, light scattering at ninety degrees ratioed against light transmission, and small angle forward light scattering ratioed against light transmission - allow the breadboard monitors to measure oil linearly over the range of 0 to 100 ppm when oil type is known. Also, a second phase feasibility study is described. The work includes: modifying the monitors to improve their sensitivity and selectivity to oil, thus reducing the envelope of curves due to different linear responses to different oil types, and reducing background bias due to particulates or varying water conditions; resolving areas of uncertainty that came to light during the first phase; and demonstrating the instruments' capabilities and limitations in monitoring the effluent from an oily water separator. AMOUNTS AND SPECTRAL PROPERTIES OF DISSOLVED ORGANIC COMPOUNDS FROM SOME FRESHWATER OF THE SOUTHEASTERN U.S.,
Savannah River Ecology Lab., Aiken, S. C.
W. M. Lewis, Jr., and J. A. Tyburczy.
Arch Hydrobiol. 74(1), p 8-17, 1974. (In Engl. with Engl. and Ger. summ.).

Descriptors: *Southeast U.S., *Organic compounds, Freshwater, Dissolved solids, *Gas chromatography, *South Carolina, Coastal plains, *Pollutant identification, Lakes, Rivers, Streams.

Collections of stream, river, and lake water taken from the coastal plain area of South Carolina were analyzed for dissolved organic C using gas chromatography. Complete absorbance spectra between 200-950 mn were also obtained on many of the samples so that statistical tests could be made of the intensity and form of the absorbance-organic carbon relationship at various wavelengths. Dissolved organic C levels averaged about 7 ppm in the predominately dark-water areas covered by the survey and ranged between 3-16 ppm. Correlations between organic C and absorbance reached a maximum of about 0.92 between 300-360 nm. The upper end of this range, specifically 360 nm, offers maximum sensitivity consistent with minimum relative variance as determined by the analysis of regression slopes at all wavelengths. Change in the intercept of the dissolved C-absorbance relation at various wavelengths is apparently related to the presence of 3 or more groups of compounds with differing optical properties. The data are used to derive an equation that accurately predicts dissolved organic C from absorbance at any wavelength between 260-360 nm. The precision of this prediction and its possible general applicability are discussed.--Copyright 1975, Biological Abstracts, Inc.

AN EVALUATION OF THE MILLER METHOD FOR DISSOLVED OXYGEN ANALYSIS,
Wollongong Univ. Coll. (Australia). Div. of Biology and Chemical Sciences.
J. Ellis, and S. Kanamori.
Limnol Oceanogr. 18(6), p 1002-1005, 1973.

Descriptors: *Dissolved oxygen, *Methodology, Oxygen, Salinity, *Volumetric analysis, *Analytical techniques, Pollutant identification.
Identifiers: Dissolved, Method, Miller, Oxygen, pH, Standardization, Winkler Miller method(Analysis), Winkler method(Analysis).

The Miller and Winkler methods for dissolved O2 determination are compared over a range of salinities and O2 levels. By performing the Miller titration using a capillary sidearm flask, atmospheric O2 may be excluded and a precision of +O.O5 mg O2 liter-1 obtained. The Miller end point is highly dependent on pH and on the ratio of NaOH to sodium potassium tartrate, so that carefully standardized conditions must be used to obtain accurate and reproducible results.--Copyright 1974, Biological Abstracts, Inc.

COLORIMETRIC DETERMINATION OF PARAQUAT RESIDUES IN SOIL AND WATER,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
J. D. Pope, Jr., and J. E. Benner.
J Assoc Off Anal Chem. 57(1); p 202-204, 1974.

Descriptors: *Pesticide residues, *Pollutant identification, *Colorimetry, *Agricultural runoff, *Paraquat, Herbicides, Analytical techniques, Soil analysis, Water analysis.

A modified colorimetric method is presented for the determination of paraquat in agricultural runoff samples. The soil extraction step of existing methods is shortened, making the method more suitable for routine analysis of large numbers of samples. Recoveries from spiked soil samples (0.5-5.0 ppm) and water samples (0.1-2.0 ppm) averaged 91-98 and 80-94%, respectively.--Copyright 1974, Biological Abstracts, Inc.

EFFECT OF ATMOSPHERIC STABILITY ON WATER TEMPERATURE PREDICTIONS FOR A THERMALLY LOADED STREAM,
Pennsylvania State Univ., University Park. School of Forest.
D. R. DeWalle.
Water Resources Research, Vol. 12, No. 2, p 239-244, April 1976. 3 fig, 2 tab, 19 ref. OWRT C-4199(No. 9032)(2).

Descriptors: *Model studies, *Energy budget, *Water temperature, *Heat transfer, *Discharge(Water), Air-water interfaces, Air temperature, Humidity, Wind velocity, Radiation, Equations, Pennsylvania, Atmosphere, *Thermal pollution.
Identifiers: *Atmospheric stability, *Shulyakovskiy equation, *Hefner equation, *Susquehanna River(West branch).

A steady state one-dimensional energy budget equation was numerically integrated to predict water temperatures in a 5.45-km-long thermally loaded stream reach for 131 five- or six-hour periods. Downstream water temperature prediction errors (measured minus predicted) using Jobson's Lake Hefner evaporation equation averaged -2.11 C and were well correlated (R2 = 46%) with an index to atmospheric stability. Use of a modified form of Shulyakovskiy's evaportion equation, which includes a term for evaporation by free convection, significantly reduced the average prediction error to 0.89 C and eliminated the effects of atmospheric stabilty (R2 less than 1%). Correction of wind velocity data for the velocity of the air relative to the stream velocity also reduced prediction errors. (Lardner - ISWS)

POLLUTION OF THE MEDITERRANEAN AROUND NAPLES,
Durham Univ. (England). Dept. of Botany.
C. R. C. Sheppard, and D. J. Bellamy.
Marine Pollution Bulletin, Vol. 5, No. 3, 1974, p. 42-44, 2 tab., 3 fig., 3 ref.

Descriptors: *Lead, *Zinc, *Copper, *Oil pollution, Invertebrates, Chemical analysis, *Marine benthos, Sewage, Nickel, Manganese, Mussels, *Molluscs, Bays.
Identifiers: *Mediterranean Sea, *Bay of Naples, *Castellabate, Sea urchins, Paracentrotus, Arbacia, Tissue content, *Mytilus, Italy.

The Mediterranean has a reputation for being highly polluted, and the cholera outbreak in southern Italy last year added to the concern about the condition of that sea. There have, however, been few biological surveys. An unpolluted area south of Naples has been declared a national park, to monitor the health of the Mediterranean in that area. This report compares conditions there with those in the Bay of Naples. (Katz)

EXPORT OF LEAD FROM SALT MARSHES,
Marine Biological Lab., Woods Hole, Mass. Boston Univ. Marine Program.
M. Banus, I. Valiela, and J. M. Teal.
Marine Pollution Bulletin, Vol. 5, No. 1, 1974, p. 6-9, 2 tab., 2 fig., 21 ref.

Descriptors: *Lead, *Heavy metals, Water pollution sources, *Marshes, *Marsh plants, *Sediments, *Salt marshes, Nitrogen, Grassed waterways, Grasses, Tidal effects, Tidal marshes, Tidal streams, Estuarine environment, Massachusetts.
Identifiers: Salt marsh sediments, Saltwater cardgrass, Spartina alterniflora.

Lead accumulates in shallow salt marsh sediments and is taken up by grasses. Since about half of the annual grass crop is transported to the sea after the grass dies, this may contribute to the movement of lead to deeper waters. Where nitrogen additions increase the biomass of grasses, or where very heavy lead contamination takes place, substantial amounts of lead may be removed by tides from the marsh surfaces (Katz)
W76-11717

MERCURY CONTENT OF MUSSELS FROM WEST EUROPEAN COASTS,
Central Lab. TNO, Delft (Netherlands).
P. DeWolf.
Marine Pollution Bulletin, Vol. 6, No 4, 1975, p. 61-63, 5 tab., 1 fig., 2 ref.

Descriptors: *Mussels, *Molluscs, *Commercial shellfish, *Marine fish, Food, Atlantic Ocean, Benthic fauna, *Metals, Intertidal areas, *Mercury.
Identifiers: Mytilus edulis, Mytilus galloprovincalis, France, North Sea, Denmark, England, Scotland, Rhine estuary, Belgium, Germany.

Mussels have been sampled from the east side of the North Sea from Arcachon in France to Cape Skagen in Denmark and on the west side from Lands End to Edinburgh. High levels of mercury occur in mussels taken from the vicinity of the Rhine and Eems Dollard, and values on the British coast are generally higher than on the east side of the North Sea. (Katz)
W76-11718

PLASTIC PARTICLES FOUND IN TERN PELLETS, ON COASTAL BEACHES AND AT FACTORY SITES,
American Museum of Natural History, New York.
H. Hays, and G. Cormons.
Marine Pollution Bulletin, Vol. 5, No. 3, 1974, p. 44-46, 2 fig.

Descriptors: *Industrial wastes, Environmental effects, Marine animals, *Birds, *Gulls, *Waterfowl, *Shore birds, Beaches, Seashores, Atlantic Ocean, *Food chains, Sewage, *Plastics.
Identifiers: *Polystyrene, *Terns, Tern pellets.

Small polystyrene particles, evidently of industrial origin, now appear as a contaminant of the sea in several parts of the world. They have been discovered in pellets of indigestible food regurgitated by gulls and terns, so are clearly entering the food chain at some point. So far as is known they are harmless but it would be as well to exercise caution in releasing plastic to the environment. (Katz)
W76-11720

SEASONAL VARIATION OF DISSOLVED METALS IN INSHORE WATERS OF THE MENAI STRAITS,
University Coll. of North Wales, Bangor. Marine Science Labs.
A. W. Morris.
Marine Pollution Bulletin, Vol. 54, No. 4, 1974, 54-59, 7 fig., 14 ref.

Descriptors: *Heavy metals, *Sea water, *Seasonal variability, *Salinity, *Water temperature, Analytical procedures, Chlorophyll, Zinc, Copper, Nickel, Manganese, Dissolved solids, Ions.
Identifiers: *Ionic zinc, Organically associated zinc, Ionic copper, Organically associated copper, Ionic manganese.

Many surveys of trace contaminants of seawater are based on the supposition that the situation is static. Little is known about seasonal fluctuations in the concentrations of these contaminants and less about the cause of this variation. Fluctuations in freshwater carrying metals or sediment that will trap contaminants, changes in movements of water masses in the sea, as well as the use of trace metals by marine organisms, are all contributory factors. Local hydrography, seasonal variability and physico-chemial state cannot be neglected in studies of the occurrence of dissolved trace metals in coastal waters. (Katz)

ers: *Ghyben-Herzberg aquifer, *Sand- model, Buoyant plume, Injection rates, water entrainment, Plume mechanics.

n of wastes into the Hawaiian subsurface ment presents unique problems because te effluent normally are injected into the brackish water underlying the fresh -Herzberg lens. Because waste water comhas approximately the same density as ater, in addition to any ambient groundlow effects, a buoyant uplift is produced auses the injected waste to move upward ward from the injection point as a buoyant A laboratory sand-packed hydraulic model d to study the mechanics of buoyant plume nt, and the entrainment of salt water by ie. Simulated waste effluent was injected density-stratified aquifer system under oundwater conditions, and the effects on echanics of varying several different inarameters, such as injection depth, injec-, type of injection source, density of water, etc., were observed. The laboratory studies indicated that the depth of injection with respect to the salt-fresh interface had the greatest effect on plume mechanic of any of the injection parameters varied. Variation of injection rate had the next greatest effect. It also was observed that for the conditions stipulated in this study, very little salt water was entrained by the injected waste effluent and, thus, the buoyant plume was observed to rise well into the freshwater zone.

Identifiers: *Sludge characteristics, *Sludge dumping, Diversity values, Correlation coefficients, *Nucula proxima, *Delaware Bay.

Sewage sludge from Philadelphia and Camden has been dumped off the mouth of Delaware Bay since 1961. Local residents have claimed that sludge is washed ashore, is a health hazard and has impoverished the fauna of the seabed in the area. An assessment has been made of the composition and abundance of the benthic marine fauna of the dumping grounds. The results suggest that dominant species of the area are changing as particulate organic matter accumulates. (Katz)

SAND FLATHEAD (PLATYCEPHALUS BASSENSIS) AN INDICATOR SPECIES FOR MERCURY POLLUTION IN TASMANIAN WATERS,
Tasmanian Dept. of Agriculture, Hobart (Australia). Sea Fisheries Div.
T. G. Dix, and A. Martin.
Marine Pollution Bulletin, Vol. 6(9), 1975, p. 142-143, 1 tab, 1 fig.

Descriptors: *Metals, *Mercury, *Path of pollutants, *Marine fish, *Bioindicators, *Tracers, *Demersal fish, Biochemistry, Physiology, Sites.
Identifiers: *Site dependence, Mercury concentration, Tissue mercury concentration, Fish size, *Tasmania, Sand flathead, Platycephalus bassensis.

A state-wide survey of Tasmanian coastal waters has shown that Platycephalus bassensis, a widespread, easily caught, non-migratory demersal finfish, is a useful indicator species for mercury pollution. Using approximately twelve fish at each of 31 locations, the mean total mercury concentration in the muscle tissue ranged from 0.03 to 1.06 mg/kg (fresh wt basis), and clearly demonstrated a site dependence for mercury uptake in this species. The correlation between mercury concentration and fish size is shown to be valid only if the effect of location is taken into account. Even then, size accounts for only about 10% of the total variability in mercury concentration. (Katz)

A COMPARISON OF PHOSPHORUS AND WATER CONTRIBUTIONS BY SNOWFALL AND RAIN IN NORTHEAST OHIO,
Kent State Univ., Ohio. Dept. of Geology.
M. R. McComas, G. D. Cooke, and R. H. Kennedy.
Water Resources Bulletin, Vol. 12, No. 3, p 519-527, June 1976. 2 fig, 2 tab, 15 ref. EPA R801936.

Descriptors: *Phosphorus, *Snowfall, *Phosphates, *Rainfall, *Phosphorus compounds, *Ohio, Analytical techniques, Chemistry, Water pollution sources, Snow, Snowmelt, Surface runoff, Rain, Meteorology, Water sources, Weather, Runoff, Rain water, Storm runoff, Precipitation(Atmospheric), Data collections, Watershed management.
Identifiers: *Twin Lake Watershed(Ohio), Portage County(Ohio), Fine sediment, Detention basins, Lake management.

A record snowfall of 55.8 centimeters occurred on December 1 and 2, 1974, in Portage County, Ohio. An early winter thaw melted the greater part of the snow by December 22, 1974, and a two-day rain fell from December 23 to December 25. These weather events provided an opportunity to compare snowmelt and rainfall contribution to runoff

and phosphorus loading to the Twin Lakes Watershed. Phosphorus concentrations of the snow and rain were determined. Six lake inflows and two lake outflows were measured daily for volume and phosphorus concentration. The snow added 217,000 cubic meters of water and 2.2 kilograms of total phosphorus to the watershed. The rain added 74,000 cubic meters of water and 1.6 kilograms of total phosphorus. Total water discharge from the watershed during December was 244,537 cubic meters and total phosphorus output was 20.3 kilograms. The snow provided 49.9% of the discharge and 8% of the phosphorus whereas the rainfall contributed 28% of the discharge and 6% of the phosphorus. These results indicated that, while snow is a significant source of water, it is not a large source of phosphorus. The greatest contribution of phosphorus comes from fine sediment carried by storm runoff. (Henley - ISWS)

A BOUNDARY VALUE APPROACH FOR ESTUARINE WATER QUALITY MODELLING WITH RESULTS FOR JAMAICA BAY, NEW YORK,
Texas Univ. at Austin. Dept. of Electrical Engineering.
B. J. Olufeagba, R. H. Flake, and N. E. Armstrong.
Ecological Modelling (International Journal on Ecological Modelling and Engineering and Systems Ecology), Vol. 1, No. 1, p 3-30, May 1975. 13 fig, 5 tab, 37 ref.

Descriptors: *Estuaries, *Water quality, *Mathematical models, *Algorithms, Flow, Kinetics, Constraints, Equations, Numerical analysis, Hydrodynamics, Dispersion, Salinity, Simulation analysis, Coliforms, Nitrogen, Biochemical oxygen demand, Dissolved oxygen, Systems analysis, *New York, *Path of pollutants.
Identifiers: *Jamaica Bay(NY), Nonlinear models, Total soluble phosphorus.

Results of water quality modeling for Jamaica Bay, a New York estuary with a large hydraulic circulation, are presented. The two-dimensional topology is approximated by a set of coupled one-dimensional subsystems. The long term steady state water quality problem is then reformulated as a multi-point boundary value problem for ordinary differential equations. Piecewise constant dispersion parameters are estimated from salinity data. A sequential algorithm based on parallel shooting is developed for solving the multipoint problem. The method, which simplifies handling of feedforward and feedback reaction kinetics, is equivalent to employing a high order finite difference technique with the subsequent enhanced accuracy. Results of model verification for uncoupled variables -- salinity, coliform, total soluble phosphorus -- and coupled variables for nitrogen (organic and ammonia) and BOD-DO for Jamaica Bay are discussed. (Bell-Cornell)

MODELS IN WATER QUALITY PLANNING,
Karlsruhe Univ. (West Germany). Institut fuer Siedlungswasserwirtschaft.
R. W. Abendt.
Ecological Modelling (International Journal on Ecological Modelling and Engineering and Systems Ecology), Vol. 1, No. 3, p 205-217, September 1975. 7 fig, 11 ref.

Descriptors: *Water quality, *Mathematical models, *Simulation analysis, Data collections, Methodology, Rivers, Measurement, Flow, Water temperature, Systems analysis, Equations, Europe.
Identifiers: *Neckar River quality model(W Germany), Error, Oxygen balance, Model accuracy, Black box method.

This paper shows the range of applicability of water quality models. It clarifies the purpose of modelling with respect to the exactness of results and it investigates problems of data collection. The data quantity and objective of modelling influence the model structure, i.e., the mathematical complexity. Two principal errors are investigated: first, the error caused by the mathematical abstractions of the natural processes in a model, and on a subsequent level, the wrong parameter estimates in a model. Furthermore, the difference between a deterministic descriptive, and a statistical approach, is discussed. In both model types, input and objectives are the same. But the methodology is fundamentally different. A practical example is presented based on a two-parameter water quality model. The limits and practicability of the Neckar River quality model are discussed in this context. (Bell-Cornell)

Identifiers: Sensitivity analysis, Nonlinear system, Factor decomposition approach, Reducing approach, Box model.

Considered is the modelling process in relation to the class of computerized, time-continuous, deterministic models. Following a brief discussion of the formulation of the modelling process, a description of the System Analysis and System Synthesis stages of the modeling of the eutrophication process in a sill fiord is given. Special emphasis is put on the modelling of a general column of the fiord system. Numerical solution methods relevant for long-term studies are discussed and the requirements in terms of their stability and accuracy are formulated. The goal-statements of Sensitivity Analysis are presented, followed by a description of two approaches to the understanding of model behavior. The possibility of determining the sensitivity of a nonlinear system through linearization is discussed, as is the possibility of determining the sensitivity to not well-estimated constants working directly on the nonlinear system. A means of constructing a model of the entire fiord is outlined. Finally, attention is brought to the superior modeling goals through a discussion of the utilization of a hypothetical, credible model of the eutrophication process in the fiord as an element in a tool for resource planning in pollution control. The aspects of using the ecological model in a study of water treatment plans have great importance in the process of planning investments for wastewater treatment. Alternative plans can be compared as to economy and water quality. In complex cases, mathematical programming models can be used in connection with simulation models. (Bell-Cornell)

iptors: *Burning, *Nutrients, *South na, *Cations, *Nitrates, *Phosphates, Pine Forest management, Leaching, Cation adon, Magnesium, Calcium, Potassium, Sodiampling.

novement of major cations, nitrate and nate was studied in burned and control areas outh Carolina pine forest (USA). Artificial g of litter showed that fire increased the ity of cations by the following factors: Ca 0x; Mg ++, 10x; Na +, 2.3x; K +, 2.3x. l leaching over a 1 mo. period reduced the ld of burned litter by 80%-83% for divalent and 45%-63% for monovalent cations. ts of soluble nitrate and phosphate were l in burned and unburned litter samples. and phosphate were substantially higher in rainfall at the burned area after the burn, in subsequent rains. Collections of rainfall lout from the burned area consistently conbout twice the amounts of cations present ar collections from the unburned area. Rus low but contained greater amounts of cathe burned area. Samples of superficial groundwater provide some evidence for changes in ionic balance due to burning. Biologically available N and P in the litter is apparently not increased directly by burning, but a rise in soluble nitrate and phosphate occurs some time after the burn and is probably due to increased microbial activity. Large amounts of N are probably volatilized and could exercise important effects on the productivity of systems remote from the burn if some biologically active compounds are included in the vapor. Although the upper soil layers are an efficient adsorption trap for cations, there is a potentially important movement of ions in runoff, in groundwater, or in the wind as particulate matter following a fire.--Copyright 1975, Biological Abstracts, Inc.

COASTAL ZONE POLLUTION BY OIL AND OTHER CONTAMINANTS: GUIDELINES FOR POLICY, ASSESSMENT AND MONITORING IN TROPICAL REGIONS. BASED UPON A CASE STUDY IN INDONESIA, IN 1973,
Smithsonian Institution, Washington, D. C.
P. H. Freeman.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 431, $6.00 in paper copy, $3.00 in microfiche. Report Prepared for the Agency for International Development, Dept. of State, 1974. 144 p, 2 fig, 10 tab, refs, 3 append. AID/csd-2608.

Descriptors: *Continental Shelf, *Bibliographies, Pollutants, *Tropical regions, *Pollution abatement, *Water quality control, *Oil pollution, *Environmental effects, *Oil spills, Resources development, Monitoring, Coasts, Fisheries, Cadmium, Mercury, Insecticides, Beaches, Mangrove swamps, Management, Public health.
Identifiers: *Outer Continental Shelf, *Indonesia, Coastal zone, Pollution prevention, Policies, Guidelines, Biological effects, Organochlorine, Coral reefs.

The report provides guidelines useful to tropical nations for the prevention and control of pollution of coastal waters by oil and other contaminants. It reviews the state of knowledge on the effects of pollution by oil in warm tropical waters, sets forth information needed for determining policies for controlling coastal zone pollution by oil, outlines several policy options and their implications and presents recommendations for monitoring coastal pollution. Included in the report is an Annotated Bibliography on the Biological and Ecological Effects of Oil Pollution in Tropical Waters, compiled by C. P. Onuf. (See also W76-11936) (Sinha-OEIS)

RESULTS OF OCEAN DIFFUSION AND BIOLOGICAL STUDIES OF THE HOLLYWOOD, FLORIDA, OCEAN OUTFALL,
Environmental Science and Engineering, Inc., Gainesville, Fla.
J. D. Crane, and R. H. Jones.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 684, $5.50 in paper copy, $3.00 in microfiche. U. S Environmental Protection Agency, Ecological Research Series No. EPA-600/3-76-003, January 1976. 109 p, 19 fig, 15 tab, 21 ref, 3 append. 57(RI)-01-68.

Descriptors: *Outfall sewers, *Sewage effluents, *Coliforms, *Pathogenic bacteria, Ecology, *Environmental effects, *Waste disposal, Continental Shelf, Florida, Bacteria, *Diffusion, Water pollution sources, *Path of pollutants, *Florida.
Identifiers: *Outer Continental Shelf, Hollywood(Fla).

Full-scale diffusion experiments were conducted to estimate coliform bacteria concentration patterns of sewage effluent from two ocean outfalls located at Pompano Beach and Hollywood, Florida. The experiments consisted of two parts: turbulent diffusion of sewage effluent, and natural die-off of coliform bacteria. For the majority of the diffusion experiments, Rhodamine dye was injected at a continuous rate into the sewage at the sewage treatment plants. Experimental determinations of coliform die-off rates indicated that during the summer months the natural die-off is approximately two orders of magnitude greater than that during the winter. The biological studies consisted of qualitative and quantitative evaluations of the microscopic algae and protozoa of the surface waters and the ocean floor to a distance of about two miles from shore. Detectable effects of the Hollywood outfall were confined to a very small mixing zone in the immediate vicinity of the outfall outlet in which a reduction of plankton was observed. Phytoplankton increase, which would be expected from nutrient enrichment, was not observed to occur as a result of the Hollywood outfall in the areas surveyed. The studies provide no indication that sewage release through the Hollywood outfall had any significant effect on aquatic ecology. (Sinha - OEIS)

A COMPUTER SIMULATION TECHNIQUE FOR OIL SPILLS OFF THE NEW JERSEY-DELAWARE COASTLINE,
Coast Guard Research and Development Center, Groton, Conn.
M. C. Miller, J. C. Bacon, and I. M. Lissauer.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A018 947, $4.00 in paper copy, $3.00 in microfiche. Final Report No. USCG-D-171-75, September 1975. 48 p, 37 fig, 7 ref.

Descriptors: *Continental Shelf, *Oil spills, *Oil pollution, *Resources development, *Environmental effects, Models, Shores, Beaches, Drilling, New York, New Jersey, Delaware, Hydrodynamics, *Path of pollutants.
Identifiers: *Outer Continental Shelf, *Offshore technology, *Deepwater ports, *New York Bight, *Computer simulation.

Predictions of the movement of oil slicks and their impact locations along the shoreline of New Jersey and Delaware were determined for two potential deepwater ports and two potential drilling sites. A hydrodynamical-numerical model for the New York Bight area was coupled with a wind generating model to produce temporal patterns of concentration of oil. Shoreline impact determinations were made for the four spill sties for the average winter storm conditions and average summer high pressure systems generated by the models. (Sinha - OEIS)

THE ENVIRONMENT AND THE OFFSHORE OIL INDUSTRY IN SCOTTISH WATERS - A REVIEW. PART 1. THE DEVELOPING MARITIME GEOGRAPHIC PATTERN,
Newcastle upon Tyne Polytechnic (England). Dept. of Humanities.
H. D. Smith.
Maritime Studies and Management, Vol 3, No 4, p 205-215, April 1976. 3 fig, 4 ref.

Descriptors: *Oil industry, *Resources development, *Environmental effects, *Water pollution sources, *Oil pollution, *Hazards, Exploration, Continental Shelf, Pipelines, Offshore platforms, Weather, Facilities.
Identifiers: *Outer Continental Shelf, *Scotland, *North Sea, Geographic patterns, Production facilities, Offshore technology.

The developing maritime geographic pattern with special reference to Scottish waters is examined and the relationships between the oil industry and the marine and coastal environments are considered. Important geographical reasons exist for discussing the offshore oil industry primarily with respect to Scotland. First, substantial parts of both proved and potential oil provinces lie in Scottish waters. Sea-bed topography and the configuration of land and sea on a North-West European scale are further reasons why Scotland together with North-East England has become the primary focus of the offshore oil industry of Europe. To understand the relationships between the oil industry and the environment in these areas, several overlapping phases of development must be recognized. First is the exploratory phase which concerns the discovery or delineation of petroleum reserves, associated with the build-up of the service industry in the wider sense and the forging of links with ancillary industries in the manufacturing and service sectors of the economy. The second phase concerns the manufacture and installation of production facilities, associated with the establishment of specialist industries such as production platform construction and pipe-coating; offshore engineering tasks such as pipeline laying and the placing of production platforms and other equipment on the sea bed; and the construction of tanker and gas terminals. The third phase is production. At present the industry is involved in both exploration and the installation of the first production facilities. The pipelines and platforms have already had an impact upon the fishing industry. (See also W76-11946) (Sinha-OEIS)

THE ENVIRONMENT AND THE OFFSHORE OIL INDUSTRY IN SCOTTISH WATERS - A REVIEW. PART 2. THE REGIONAL PATTERN OF DECISION MAKING,
Newcastle upon Tyne Polytechnic (England). Dept. of Humanities.
H. D. Smith.
Maritime Studies and Management, Vol 3, No 4, p 217-220, April 1976. 5 ref.

Descriptors: *Continental Shelf, *Oil industry, *Environmental effects, *Resources development, *Water pollution sources, *Oil pollution, *Decision making, Regions, Regional analysis.
Identifiers: *Outer Continental Shelf, *Scotland, *North Sea, Production facilities, Environmental impact.

This part of the two part review presents an account of the regional pattern, in which the relationship between decision-making and environmental factors are outlined. Clear conflicts of interest have emerged in most of the platform-yard projects between those concerned with conservation of the environment and safeguarding of local community interest on the one hand, and those representing the interest of business and sometimes government on the other. From the environmental point of view, the regional development of the oil industry falls into two contrasting areas. Existing and projected large-scale developments, often on old industrial sites around the Forth, Clyde, and in north-east England, are generally welcomed as diversifying existing industry and employment, thus providing the basis for a sounder regional economy. The second group of regions are those in which pressure of development is greatest and is likely to revolutionize the social and economic structure as well as having several environmental repercussions. Many of the peripheral land areas near the petroleum provinces are remote from major centres of population and industry, as well as being areas of high amenity value. The marine environment itself is also in danger from pollution. While the Inner Sound area falls into this category, and the lochs of the Clyde will be affected considerably, there are undoubtedly three major regions in which environmental and indeed social impact are relatively very great. These are north-east Scotland, the Cromarty Firth and Shetland. The environmental issues and their implications in each of the three areas are discussed. (See also W76-11945) (Sinha - OEIS)

Geochemical investigations in Poole Harbour a its tributary drainage were begun in 1969. In t study the relationships between trace eleme concentrations of water and sediments were amined within several estuaries utilized by oyster industry. Unexpectedly, elevated levels cadmium were recorded in waters from the h bour at Poole, which could not be related to geochemical characteristics of the input draina An oyster hatchery established at Poole moved, March 1972, to a new site within Poole town, immediately encountered problems in the rear of larvae. As elevated cadmium concentrati had already been recorded in the upper harb waters a more detailed examination of the distri tion of trace metals in the vicinity of the hatch was initiated. Concentrations of cadmium, cob copper, iron, lead, manganese, nickel and zinc waters, sediments and biota of Poole Harbour reported. (Katz)

Identifiers: Carcinogens, *Methylam *Dimethylnitrosamine, *Amines, Thiram.

Added trimethylamine is converted dimethylamine in samples of raw sewage an water, and the secondary amine thus form added dimethylamine disappears with time rates of formation and disappearanc

ethylamine are governed by the pH and the
e and amount of inorganic N present. Ammoni-
is generated from both of the amines.
ethylnitrosamine, a potent carcinogen, is
ied in small amounts in samples of sewage and
water receiving dimethylamine and nitrite, the
imum nitrosamine level detected rising with
easing acidity and increasing dimethylamine
nitrite concentrations. Dimethylnitrosamine
appears in sewage and lake water samples
ving trimethylamine. Microorganisms are in-
ed in some stage of the conversion of the terti-
mine to the secondary amine and dimethyl-
samine in sewage because these products are
found in sterilized sewage. The fungicide
n (tetramethylthiuram disulfide) is converted
methylamine in sterilized sewage at pH 4.0,
mall amounts of dimethylnitrosamine are also
iced in the presence of nitrite; the yields of
products are far greater in nonsterile, thiram-
ded sewage. The identification of dimethyl-
amine was verified by thin-layer and gas
natography, UV and IR spectrometry, and
ined gas chromatrophy-mass spectrometry.--

5C. Effects Of Pollution

DISINFECTION, DECHLORINATION AND TOXICITY TO FISH,
International Pacific Salmon Fisheries Commission, Cultus Lake (British Columbia). Sweltzer Creek Salmon Research Lab.
J. A. Servizi, and D. W. Martens.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 34-44. 4 tab, 18 ref.

Descriptors: *Chlorination, *Toxicity, *Mortality, *Sewage treatment, *Sockeye salmon, Bioassay, Treatment facilities, Fish, Sewage treatment effluents, Water pollution effects.
Identifiers: *Dechlorination.

Studies on chlorine toxicity to fish are reviewed, with particular emphasis on the effect of chlorine disinfection during primary sewage treatment. Continuous flow bioassays on sockeye salmon fingerlings exposed to various dilutions of sewage before and after chlorination revealed that chlorine residuals sufficient to meet disinfection criteria substantially increased the toxicity of the primary effluent. A chlorine concentration of 25% (by volume) in the primary effluent generally resulted in the death of juvenile sockeye within about 96 hours. Chlorination caused a decrease in the average mean survival time from 293 minutes to 32 minutes. Dechlorination using sulfur dioxide brought the mean survival time from 32 minutes up to 434 minutes. Although a comparison of the mean survival times of primary and dechlorinated sewage suggests that the process of chlorination-dechlorination removes more toxicity than that caused by chlorine addition alone, the result is of limited practical significance since the lowest concentration at which mortalities occurred was the same (17% by volume) for both effluents. W76-11645

VIRAL CONTAMINATION OF THE WATER ENVIRONMENT, AN UNDERESTIMATED PROBLEM,
Canada Centre for Inland Waters, Burlington (Ontario).
M. S. Mahdy.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 45-64. 1 fig, 7 tab, 31 ref.

Descriptors: *Viruses, *Sewage treatment, *Public health, *Water quality, Water pollution effects, Urine, *Waste water treatment, Infection, Microorganisms, Aquatic microbiology, Diseases.
Identifiers: Feces, Human wastes.

Potential hazards associated with viral contamination of the water environment are discussed. Human viruses shed in the feces and urine have been repeatedly detected in sewage, effluents, and water bodies receiving effluent streams; their presence appears to be due to incomplete inactivation during sewage and water treatment. Viruses that are shed in the feces and/or urine of man include the entero-, adeno-, reo-, cytomegalo, and orbi-viruses as well as hepatitis. With the exception of three types of polioviruses, there are no vaccines available for use by potentially exposed populations. Virus removals in waste water treatment may range from 50-99.9%, depending on the type of treatment. The relatively long survival times of viruses combined with the fact that very small amounts of viruses are capable of infecting a susceptible host suggest the need for increased emphasis on evaluating the types of viruses circulating in communities and the efficiency of sewage treatment techniques. FACTORS INFLUENCING NITRATE TRANSFORMATIONS IN SEDIMENTS,
Purdue Univ., Lafayette, Ind. Agricultural Experiment Station.
R. E. Terry, and D. W. Nelson.
Journal of Environmental Quality, Vol. 4, No. 4, p 549-554, October-December 1975. 7 tab, 16 ref. OWRT A-019-IND(5)

Descriptors: *Nitrification, *Denitrification, *Eutrophication, *Nitrates, Temperature, Sediments, Aeration.
Identifiers: *Immobilization.

The effects of environmental and procedural factors (e.g., aeration, size of sample water/sediment ration, nitrate concentration, glucose addition, temperature, and sterilization) on denitrification in lake and reservoir sediments were evaluated by incubation nitrate-amended natural sediments in the laboratory. The standard laboratory procedure adopted for denitrification studies involved the incubation of small samples of sediment (undried) after addition of a nitrate solution. Denitrification in sediment-water samples was not enhanced by continuously purging samples with helium to create artificial anaerobic conditions. Even though glucose additions enhanced denitrification by 25 to 30%, unamended sediments contained sufficient available organic-D for near maximal rates of denitrification. Denitrification in sediments increased with increasing temperature over the range of 5 to 23C. However, significant denitrification occurred at temperatures as low as 5C. The evaluation of factors affecting denitrification in sediment show that the environmental conditions likely to exist in natural sediments are suitable for denitrification. Anaerobiosis and the high organic matter of most sediments create an ideal environment for microbial denitrification. The levels of nitrate in surface water may in part be controlled naturally by denitrification in sediments. (Skogerboe-Colorado State)

BACTERIAL POPULATIONS OF AQUATIC SYSTEMS RECEIVING DIFFERENT TYPES OF STRESS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
D. S. Cherry, R. K. Guthrie, and R. S. Harvey.
Water Resources Bulletin, Vol. 10, No. 5, p 1009-1016, October 1974. 1 fig, 3 tab, 7 ref. OWRT A-022-SC(10).

Descriptors: Freshwater, *Streams, *Bacteria, *Thermal stress, Effects, Pollutants, *Chemical wastes, Water temperature, Sampling, Effluents, Assessment, Water pollution effects.

Identifiers: *Chemical stress, Aquatic systems, Flowing streams.

Bacterial populations in a fast flowing stream receiving chemical wastes and in a slower flowing pond receiving a thermal addition 3-5 C above ambient temperature were compared with populations in a nonpolluted converging stream and an adjacent unheated pond. Parameters measured were total aerobic heterotrophic bacteria, bacterial diversity, percent chromagens of the total bacterial populations, and water temperature. Analyses of monthly samples plated on dilute Standard Plate Count Agar indicated that chemical additives to the waste stream significantly decreased the percent of chromagenic bacteria, and that thermal stress significantly altered total counts and bacterial diversity in the flowing pond. The effects of potential pollutants on these aquatic systems were assessed and are discussed on the basis of results obtained over a 16-month period. (Bell-Cornell)

CHANGES IN THE ACTIVITY OF FUCOXANTHIN-EXCITED PHOTOSYNTHESIS IN THE MARINE DIATOM PHAEODACTYLUM TRICORNUTUM GROWN UNDER DIFFERENT CULTURE CONDITIONS,
Tokyo Univ. (Japan). Ocean Research Inst.
S. Shimura, and Y. Fujita.
Marine Biology, Vol. 33, p. 185-194, 1975. 2 fig, 6 tab, 28 ref.

Descriptors: *Photosynthesis, Laboratory tests, *Diatoms, Algae, *Primary productivity, *Chlorophyll, Light, Pigments, Temperature, Environmental effects, *Absorption, *Photoactivation, *Plant pigments, Biochemistry, Phytoplankton, Aquatic plants, Carbon cycle, Nutrients.
Identifiers: *Phaeodactylum sp. *Fucoxanthin.

Variation in the photosynthetic activity under monochromatic light was studied in Phaeodactylum tricornutum grown under various culture conditions, with special reference to the composition of photosynthetic pigments. Photosynthetic activity, under light-limiting conditions, was reduced when the cells were grown under strong light. The reduction was more extensive in activity resulting from fucoxanthin-excitation than in that from chlorophyll a-excitation. The diminution in activity for fucoxanthin-excited photosynthesis did not correlate with variations in the pigment content. A similar diminution was observed with chlorophyll a fluorescense upon excitation of fucoxanthin. The change was accelerated by lowering the culture temperature or limiting the supply of nitrogen source. The results were interpreted in terms of a nitrogen-deficient state for algal cells induced by strong light, low temperature or a limited supply of nitrogen. This leads to a modification of the physicochemical state of in vivo fucoxanthin, so that the excitation energy of fucoxanthin is less efficiently transferred to chlorophyll a. The significance of the phenomenon in the oceanic primary production is discussed. (Katz)

Identifiers: Tufted duck, Goldeneye, Dundee, *Tay estuary(Scotland).

Many British estuaries are important wintering areas for large numbers of northern European wildfowl, and some of the biggest concentrations of the birds feed off large sewer outfalls. The Scottish Ornithologists' Club is organizing a survey to locate the major outfalls along the Scottish coast and the large concentrations of wildfowl which may be dependent upon them. Detailed studies are being made of the flocks feeding off the outfalls in the Tay which serve the city of Dundee. Main findings to date in the Tay are summarized. (Katz)

Identifiers: *Fouling organisms, *Test panels, *Arabian Gulf, *Polychaetes, Kuwait, Polychaetes, Species diversity.

The tube-building polychaete Pomatoleios kraussii is an important fouling organism in the Arabian Gulf. Studies have been made of its growth and survival on plates immersed in the water at two sites at Kuwait, one subject to frequent small spillages at an oil terminal, the other free from oil pollution. The temporal sequence and diversity of other encrusting organisms has also been documented at the same sites. P. Kraussii survival decreases as the area coated with oil increases. (Katz)

Marine Pollution Bulletin, Vol. 6, No. 4, 1975, p. 57-61, 5 tab., 21 ref.

Descriptors: *Mercury, *Selenium, Zinc, Copper, Arsenic, Cadmium, Lead, *Marine fish, *Australia, Commercial fish, Foods, Metals, *Heavy metals, Water pollution sources, Water pollution effects.
Identifiers: *Black marlin, Muscle mercury, Liver mercury, Fish size, Correlation

Black marlin from the apparently unpolluted waters off north-eastern Australia have the highest muscle and liver concentrations of total mercury yet reported for a teleost species. Selenium concentrations are also high. There is a significant correlation between mercury and selenium concentrations, and concentrations of both those elements are significantly correlated to size of fish. Concentrations of cadmium, lead, zinc, copper or arsenic are not so correlated. The results of this study indicate there is a need for a moratorium on the use of this species for human consumption. TRACE METAL CONCENTRATIONS IN FUCUS FROM THE BRISTOL CHANNEL,
University Coll. of Wales, Aberystwyth. Dept. Geology.
R. Fuge, and K. H. James.
Marine Pollution Bulletin, Vol. No. 1, 1974, p. 12. 1 fig, 2 tab, 9 ref.

Descriptors: Marine plants, *Metals, Zinc, Copper, Manganese, Iron, Nickel, Cadmium, Cobalt, Molybdenum, *Algae, Atlantic Ocean, Water pollution effects, *Trace elements, Absorption.
Identifiers: *Bristol channel, *Brown seaweed, *Fucus vesiculosus, *Trace metals.

Brown seaweeds are unable to regulate their uptake of trace metals and can therefore be used to provide a running average of metal contamination in the surrounding waters. There are many sources of error, however, and misleading results can be obtained if attention is not paid to factors that influence the metal concentrations in the weed. This becomes particularly important when comparing the results of different investigators. (Katz)

DIETARY HABITS AND HEAVY METAL CONCENTRATIONS IN FISH FROM THE SEVERN ESTUARY AND BRISTOL CHANNEL,
Bath Univ. (England).
M. W. Hardisty, S. Kartar, and M. Sainsbury.
Marine Pollution Bulletin, Vol. 5, No. 4, 1974, p. 61-63, 2 tab., 1 fig., 3 ref.

Descriptors: *Heavy metals, *Marine fish, *Pollutants, Commercial fish, *Zinc, *Cadmium, *Lead, Atlantic Ocean, Mullets, Feeds, Feeding rates, Diets, Channels.
Identifiers: Liparids, Bearded Rockling, Flounder, Whiting, Grey Mullet, *Bristol Channel(England).

Comparisons of the rates of growth, feeding habits and heavy metal levels of flounders from Barnstaple and Oldbury-on-Severn have shown that average the fish from the North Devon coast larger than those from the middle Severn estuary and that there are marked differences in diet. These differences in diet may contribute to much higher zinc levels of the Barnstaple flounder samples. In the six other fish species which have been examined, there is a distinct correlation between the cadmium concentrations of the tissues and the proportion of crustaceans in the

ead concentrations appear to follow a similar end, but no relationship could be detected etween diet and tissue zinc levels. (Katz)

TION OF ABNORMAL POLYCHAETE E BY HEAVY METALS,
ia State Univ., Long Beach. Dept. of

ish, F. Piltz, J. M. Martin, and J. Q. Word.
Pollution Bulletin, Vol. 5, No. 8, 1974, p 1 tab, 1 fig, 1 ref.

Descriptors: Metals, *Annelids, *Copper, *Zinc, *Pathology, Benthos, Marine benthos, *Larvae, *Larval growth states, *Heavy metals, Lethal limit.
Identifiers: *Marine polychaetes, Capitella capitata, Sublethal effects, Fatal abnormalities, Polychaete larvae, Abnormal larvae.

A little known observation that exposure to sublethal concentrations of detergent cause fatal abnormalities in the second generation of a polychaete has been followed up and similar abnormalities have been observed in the first or second generation of larvae exposed to sublethal concentrations of copper and zinc. Few toxicity tests extend beyond the responses of the exposed individuals. The discovery of a delayed reaction to sublethal concentrations of common contaminants of the sea has unknown but potentially important ecological implications. (Katz)

SEABIRD MORTALITY IN THE NORTH IRISH SEA AND FIRTH OF CLYDE EARLY IN 1974,
Royal Society for the Protection of Birds, Sandy (England).
C. Lloyd, J. A. Bogan, W. R. P. Bourne, P. Dawson, and J. L. F. Parslow.
Marine Pollution Bulletin, Vol. 5 No. 9, 1974, p 136-140, 1 fig, 5 tab, 8 ref.

Descriptors: *Organochlorine pesticides, *Mortality, *Birds, *Oil pollution, Oily water, *Oil spills, Pathology, Non-game birds, Polychlorinated biphenyls, Dieldrin, DDE, Toxicity.
Identifiers: Tissue analysis, Guillemots, Cormorant, Shags, Gulls, Terns, Auks, *Sea birds, *Irish Sea, *Firth of Clyde.

Heavy mortality of guillemots in the Irish Sea was recorded in 1969 and was the subject of a detailed enquiry. Organochlorine contamination was thought to be a contributory factor, although this could not be conclusively established. These persistent pollutants remain in the environment and further mortalities might be expected if they were indeed responsible. In January, 1974, there was a further heavy loss of seabirds in the area and, this time, investigators were prepared and the incident was carefully monitored. (Katz)

ECOLOGY OF PLANKTONIC INFUSORIA OF SECONDARY-OLIGOTROPHIC LAKE, (IN RUSSIAN),
Gorkii State Univ. (USSR).
M. A. Petrova, and T. P. Smirnova.
Gidrobiol Zh. 10(3), p 25-30, 1974.

Descriptors: *Eutrophication, Lakes, *Oligotrophy, *Plankton, *Ecology, *Protozoa, Seasonal, Distribution, Vegetation, Reproduction.
Identifiers: *Infusoria reproduction, Lionotus-fasciola, Russian-SFSR, Vorticella-campanula, Vorticella-nebulifera, *Lake Svetloyar(USSR).

Investigations of protozoan plankton in the secondary-oligotrophic Lake Svetloyar (Russian SFSR, USSR) showed that it is represented by a restricted number of species. Among them only Lionotus fasciola, Vorticella nebulifera and V. campanula are abundant and account for the largest part of the Protozoa production. The distribution of Protozoa follows the course of the temperature curve; during the vegetative season their bulk is confined to the layers of epi-and metalimnion. The infusoria reproduction rate varies within 0.5-2.4 divisions a day and depends on the cell dimensions. The relation of the reproduction rate to the intensity of consumption is shown. Protozoa production in Aug. and Sept. was 11.7 and 3.1 g/m2, respectively.--Copyright 1975, Biological Abstracts, Inc.

EFFECT OF TRIETHYLTIN CHLORIDE ON THE INCORPORATION OF INORGANIC CARBON (NAHC14O3) FROM THE ENVIRONMENT INTO CARP METABOLIC PROCESSES, (IN RUSSSIAN),
Moscow State Univ. (USSR).
N. S. Stroganov, O. V. Parina, and K. F. Sorvachev.
Gidrobiol Zh. 10(5), p31-35, 1974.

Descriptors: *Chlorides, Organic compounds, *Carp, *Absorption, *Metabolism, Water pollution effects, *Carbon, Carbonates, Fish behavior, *Inhibition.
Identifiers: Carbon-14, Glycogen, Triethyltin chloride, Inorganic carbon.

Triethyltin chloride (TETC) in a concentration of 0.01, 0.1 and 1 mg/l affected absorption of inorganic carbon (NaH14CO3) by (Cyprinus carpio) from the water environment and its incorporation into the metabolic processes. With 0.001 and 0.1 mg/l concentrations of TETC no noticeable deviations in fish behavior were observed for 40 days of the experiment, but changes were observed in 14C uptake by blood, white and red muscle, liver and brain. The most noticeable changes occurred in carbohydrate metabolism of the liver and brain. TETC inhibited de novo synthesis of glycogen in all the organs under study, the inhibition being especially sharp in the brain tissue.--Copyright 1975, Biological Abstracts, Inc.

THE EFFECT OF PESTICIDES ON THE QUALITY OF BODIES OF WATER, (IN RUSSIAN),
Institut Hygieny a Epidemiologie, Prague (Czechoslovakia). Dept. of General Public Hygiene.
Y. Pokorni, and K. Kulikova.
Gig Sanit. 1, p 89-91, 1974.

Descriptors: *Water quality, *Pesticide toxicity, Water pollution effects, *Pesticides, Water pollution control, *Toxicity, Water quality standards, *Lethal limit, Algae, Phytoplankton, Protozoa.
Identifiers: *Czechoslovakia.

Various types of pesticides, their influence on the quality of surface waters, and water pollution prevention measures are discussed. Studies were conducted at the Prague Institute (Czechoslovakia) to determine the influence of the pesticides on water organisms (algae, protozoa, phytoplankton and laboratory fish). The sensitivity of fish to different pesticides, their influences on the taste (taste to someone eating it) of the fish, as well as their toxicity were tested. It is necessary to determine the hygienic, allowed concentrations of pesticides in surface waters, in order to be able to devise the necessary sanitary measures.--Copyright 1975, Biological Abstracts, Inc.

FORECASTING THE DANGER OF ORGANIC COMPOUNDS IN THE ENVIRONMENT, (IN RUSSIAN),
S. D. Zaugol'nikov, M. M. Kochanov, M. M. Loit, and A. O. Stavchanskii.
Gig Sanit. 5, p 81-86, 1974.

Descriptors: *Forecasting, *Environment, *Organic compounds, *Toxicity, *Solubility, *Volatility, Water analysis, Air pollution, Regression analysis, Atmosphere, Lethal limit.
Identifiers: Nomograms, Boiling points(Organic compounds).

An analysis of the data on 43 substances in the air of industrial rooms, 30 substances in the atmosphere of populated areas and 26 substances in bodies of water established that the danger of their effect is determined not only by their toxicity but also to a considerable extent by their volatility and solubility. A method of approximate determinaton of the degree of real danger of chemical compounds was developed which is based on the dependence of the index of the degree of real danger on the boiling point of the substance and maximum allowable concentration, expressed as linear equations of multiple regression for industrial rooms, atmosphere of populated areas and bodies of water. For convenient practical use of the method, a nomogram is given by means of which the degree of real danger of a substance can be determined approximately if the boiling point of the substance and the maximum allowable concentration in the pertinent environment are known.--Copyright 1975, Biological Abstracts, Inc.
W76-11734

THE IMPORTANCE OF ZOOPLANKTON IN THE METABOLISM OF LAKE SCHIEREN, (IN GERMAN),
K. E. Nowak.
Arch Hydrobiol. 75(2), p 149-224, 1975.

Descriptors: *Zooplankton, Lakes, Europe, Algae, *Metabolism, Bacteria, Cycling nutrients, Minerology, Eutrophication, Seasonal, Phytoplankton.
Identifiers: *Lake Schieren(W Germany).

In the euproductive Schierensee (West Germany) zooplankton plays a decisive role in the breakdown and direct utilization of living algae, bacteria and zooplankton. The contribution of zooplankton to direct and indirect mineralization processes and recycling of nutrients makes it the driving force in the rapid metabolism of this particular lake. The typical clear water stage that occurs in many lakes in June is caused to some extent by lack of phosphate and other nutrients but also by the high bioactivity of zooplankton. In spring and early summer this bioactivity is nearly double that in autumn; this is due to poor utilization of the algae which dominate in autumn. In spring the assimilation of organic substances, mainly organisms, reaches a peak of 70-90% of the rate of primary production, and 50-60% only in autumn. Evidently there is a close correlation between quality and quantity of phytoplankton and the development and bioactivity of zooplankton.--Copyright 1975, Biological Abstracts, Inc.

CHARACTERISTICS AND PRODUCTION POTENTIALS OF ZOOPLANKTON FROM LAKE SHCHELKUN IN THE MIDDLE URALS, (IN RUSSIAN),
Ural and Siberian Fishery Scientific-Research and Planning Inst., Sverdlovsk (USSR).
I. V. Kozlova.
Gidrobiol Zh. 10(3), p 31-38, 1974.

Descriptors: *Zooplankton, Lakes, *Biomass, Vegetation, Ice, *Productivity.
Identifiers: *Bosmina-Longirostris, Russian-SFSR, Urals, *Lake Shchelkun(USSR).

Zooplankton development dynamics in Lake Shchelkun (Russian SFSR, USSR) and its connections with the hydrometrological conditions and elevation in the water level are given for the period from Feb., 1969-Feb., 1972. The main zooplankton complex remains constant in spite of the total biomass fluctuations within wide limits (0.56-6.23 g/m3 in the vegetation period, 0.001-0.22 g/m3-under ice). Data are presented on the biology of some mass zooplankton species. The bulk of production of foor zooplankton in the vegetation period of 1971 was formed in Aug.-Sept., when Bosmina longirostris dominated the plankton.--Copyright 1975, Biological Abstracts, Inc.

ON THE PROROCENTRUM RED TIDE OCCURRED IN THE COASTAL WATERS OF TOYOURA, FUNKA BAY, HOKKAIDO, IN SEPTEMBER, 1973, (IN JAPANESE),
A. Iizuka, and S. Komaki.
Bull Hokkaido Reg Fish Res Lab. 40, p 60-66, 1974.

Descriptors: *Red Tide, Plankton, *Dinoflagellates, Bays, Metabolism, Dissolved oxygen, Salinity, Water pollution effects.
Identifiers: Coastal waters, Halocline, Hokkaido, *Japan(Funka Bay), *Prorocentrum, Prorocentrum-micans, Scallop, Toyoura.

Prorocentrum, Dinoflagellata has often occurred as red tide plankton in polluted inland waters of Honshu, but in Hokkaido (Japan) the red tide species was rarely seen until 1972. In Sept. 1973 the 1st occurrence of the red tide, composed of the monotonic species, P. micans Ehrenberg, was observed in the coastal waters of Toyoura and its adjacent area, Funka Bay, Hokkaido. In coastal waters with a depth of 15-20 m, the surface water to about 0.5 m had a low salinity of 25.06-29.59%, and at the greater depths, 30.00-33.67%, therefore a sharp halocline was found between 0.5-1 m. Near the red tide, dissolved O2(DO) reaches 160-168%, and chemical O2 demand (COD) of dissolved matter reaches 2.6-5.8 mg/l. The increase in DO COD in the sea water seemed to be caused by active metabolism of the red tide species. Damage of the scallop cultivated in this area was not found in spits of the relatively long duration of the red tide.--Copyright 1975, Biological Abstracts, Inc.

NITROGEN CYCLING IN MICROCOSMS AND APPLICATION TO THE BIOLOGY OF THE NORTHERN ARM OF THE GREAT SALT LAKE,
Utah State University, Logan Dept of Biology
J. C. Stube, J. Post, and D. B. Porcella
Available from the National Technical Information Service, Springfield Va 22161, as PB-257 063, $5.00 in paper copy, $3.00 in microfiche. Utah Water Research Laboratory Logan. Publication PRJSBA-016-1, 77 p, June 1976. 43 fig, 28 tab, 111 ref, 3 append. OWRT A-024-UTAH(2), 14-34-0001-6046.

Descriptors: *Nitrogen compound, *Nitrogen cycle, Water pollution sources, Water pollution, Waste water(Pollution), *Halophilic animals, *Halophytes, Algae, Denitrification, *Utah, *Saline, lake, Organic matter, Brine shrimp, Nitrogen fixation, Nitrate, Nitrites, Bacteria, Ammonia, Nutrients, *Cycling nutrients.
Identifiers: *Great Salt Lake(Utah), Halobacterium, Halococcus, Dunaliella salina, D. viridis, Artemia salina, Ephydra gracilis, E. Hians, Brine fly.

Nitrogen cycling was studied in the hypersaline north arm of the Great Salt Lake. The lake, particularly the north arm, has a massive accumulation of organic matter from at least 10 cycles in the last 100,000 years from a freshwater to a saline lake, plus the influence of human industry and agriculture in more recent times. The north arm planktonic and attached community consists of principally, in order of biomass: bacteria of at least two genera, Halobacterium and Halococcus; two algae, Dunaliella salina and D. viridis; the brine shrimp, Artemia salina; and, two species of brine fly, Ephydra gracilis and E. hians an possibly one more species. The nitrogen cycle was studied using weekly lake samples and sediment-water microcosms. Result from the lake samples indicated a high level of organic nitrogen as well as undetectable amounts of nitrate, nitrite, and nitrogen fixation. Ammonia was the only detectable inorganic nitrogen form and occured in the lake only at times of low algal activity or high excretion rates by the invertebrates or high bacterial activity. Microcosm studies demonstrated that ammonia, nitrate and urea did not stimulate the bacteria directly but did so indirectly through increased algal activity. Glutamic acid, an organic form of nitrogen, stimulated the bacteria directly. No nitrification was observed in the microcosms although nitrate is observed when the microcosms were fed nitrate (denitrification). A preliminary model of various interaction is presented and some aspects of the various organisms and their metabolism are discussed.

dy of the lower minimum temperature ments of the northern anchovy, Engraulis , was made. Juvenile anchovies held for a minimum of two weeks at acclimation temperatures of 19.5 degrees, 16.0 degrees, and 12.0 degrees were subjected to various degrees of thermal stress from 17.0 degrees to 7.0C. A lower lethal temperature of approximately 7.0C was estimated from two experimental procedures. Anchovy eggs were held at incubation temperatures between 9.0 degrees and 15.0C. At incubation temperatures below 10.0C, complete yolk absorption and starvation occurred in larvae before development of pigmented eyes and a functional jaw was completed. Behavior of juvenile ancovies in a 2.3 m horizontal thermal gradient with a temperature differential of 5.0C indicated significant selection of the warmest water available to the fish at experimental temperatures between 13.0 degrees and 25.0C. Anchovies actively avoided temperatures above 25.0C. (See also W76-11793) (Katz)

EFFECTS OF SUB-NORMAL TEMPERATURES ON SOME COMMON LOS ANGELES HARBOR ANIMALS,
University of Southern California, Los Angeles. Allan Hancock Foundation.
E. A. Norse.
In: Marine Studies of San Pedro Bay, California, Part III. Thermal Tolerance and Sediment Toxicity Studies, University of Southern California, Los Angeles. USC-SG-1-74, February, 1974. p 44-62, 3 tab, 1 fig, 16 ref.

Descriptors: Invertebrates, *Mollusks, *Mussels, *Crustaceans, *Crabs, Benthic fauna, Marine fish, *Bioassay, Cooling water, Methodology, *Water temperature, Physiology, Reproduction, Breeding, Sexual maturity, Harbors, *Mortality, *Thermal pollution, California.
Identifiers: *Coelenterates, *Arthropods, *Mytilus edulis, Pachygrapsus, Tisbe, Cladonema, Zoeal larvae, Medusae, Copepodite, Temperature tolerance, Lower minimum temperature, Sublethal effects, Swimming ability, Byssus thread formation, Reproductive rates, Subnormal temperatures, *Los Angeles Harbor(Calif).

Four species of animals belonging to three phyla (Coelenterata, Mollusca and Arthropoda) were tested to demonstrate effects of lowered temperatures. Adult Mytilus edulis and zoeal larvae of Pachygrapsus crassipes were acclimated at 21C; medusae of Cladonema sp. were acclimated at 17C, and adult and late copepodite stages of Tisbe sp. were acclimated at 21, 17, 13, and 9C. Animals were then transferred to 21, 17, 13, 9, or 5C for 24 hours. Significant mortalities occurred in 19.2% of Tisbe sp. acclimated at 21C, and 100.0% of Cladonema sp. acclimated at 17C died when transferred to 5C. (See also W76-11793) (Katz)
W76-11796

THE EFFECT OF VARIOUS WATER TEMPERATURES ON THE SURVIVAL AND REPRODUCTION IN POLYCHAETOUS ANNELIDS: PRELIMINARY REPORT,
California State Univ., Long Beach. Dept. of Biology.
P. Oshida, and D. J. Reish.
In: Marine Studies of San Pedro Bay, California, Part III. Thermal Tolerance and Sediment Toxicity Studies, University of Southern California, Los Angeles. USC-SG-1-74, February, 1974. p 63-77, 3 tab, 24 ref.

Descriptors: Water quality, *Bioassay, *Benthic organisms, Benthos, *Mortality, *Water temperature, Marine animals, Laboratory study, Aquatic environment, Thermal stress, Reproduction, Feeding rates, *Annelids, Cooling water, *Thermal pollution, California.
Identifiers: *Polychaetous annelids, Capitella capitata, Neanthes arenaceodentata, Minimum temperature, Maximum temperature.

The effects of varying water temperatures, namely 5, 9, 13, 17, 23, 26, 29, 32, and 35C, on survival, feeding, and reproduction were studied on three laboratory inbred species of polychaetous annelids. Laboratory procedures were outlined for both short term and long term experiments; the preliminary data were presented for Capitella capitata and Neanthes arenaceodentata. The maximum and minimum 28 day TLm values were 7.8 and 26.6C for Capitella capitata and 12.3 and 24.6C for Neanthes arenaceodentata. (See also W76-11793) (Katz)

University of Southern California, Los Angeles. Allan Hancock Foundation.
D. Hadley, and D. Straughan.
In: Marine Studies of San Pedro Bay, California, Part III. Thermal Tolerance and Sediment Toxicity Studies, University of Southern California, Los Angeles. USC-SG-1-74, February, 1974. p 78-96, 9 tab, 5 ref.

Descriptors: *Bioassay, *Thermal stress, Behavior, Benthic organisms, Benthos, Mollusks, Gastropods, *Water temperature, Intertidal areas, Thermal pollution, *Snails, Growth rates, California.
Identifiers: *Intertidal snails, Littorina, Attachment rate, Oxygen consumption.

This survey was conducted primarily to consider the effects of reduced water temperature on two intertidal snails, Littorina planaxis and L. scutulata. The parameters considered included mortality, attachment of animals to the substrate, size of animals, and season of the year. Additional experiments were conducted on elevated temperatures to consider whether the animals respond merely to temperature change itself, or whether the direction of temperature change is important. Within the range of 6C to 29C the response appears to be seasonal and size dependent in L. planaxis. Littorina scutulata is more tolerant of 6C than 29C. No mortality was recorded at 6C while mortality was recorded in both species at 29C. The rate of attachment was influenced by temperature in both species. This is important, because unattached animals are readily washed away from the population. Littorina scutulata had a higher attachment rate than L. planaxis at 6C. When both species are subjected to a 12C drop in temperature, there is often a short period when attachment rate is low so that the intermittent exposure to such changes could result in a gradual loss of animals through wave action during such periods. PRELIMINARY INVESTIGATIONS OF THE EFFECTS OF RESUSPENDED SEDIMENT ON TWO SPECIES OF BENTHIC POLYCHAETES FROM LOS ANGELES, HARBOR,
University of Southern California, Los Angeles. Allan Hancock Foundation.
R. R. Emerson.
In: Marine Studies of San Pedro Bay, California, Part III. Thermal Tolerance and Sediment Toxicity Studies, University of Southern California, Los Angeles. USC-SG-1-74, February, 1974, pp 97-110, 2 tab, 3 fig, 5 ref.

Descriptors: *Annelids, *Toxicity, *Mortality, *Bioassay, Laboratory animals, *Reproduction, *Productivity, Biota, Laboratory studies, *Sediments, Spoil banks, Benthos, *Suspended solids, Harbors, California.
Identifiers: *Polychaetes, *Toxic elutriates, Capitella capitata, Larvae, Trochophores, Metatrochs, Ophryotrocha, Resuspended sediments, Sea fertilizer, *Los Angeles Harbor(Calif).

Ophryotrocha nr. labronica and Capitella capitata were used as bioassay organisms to determine the toxicity of resuspended sediment from Los Angeles Harbor. Sediment was collected from four stations representing a range of polluted conditions. A test solution or 'standard elutriate' was prepared according to EPA guidelines. An additional series of dilutions and concentrations were prepared to produce a range of toxic elutriates. Mortality of Capitella capitata trochophores and metatrochs was less than 50% in all short term 96 hour exposures. Long term (28 day) exposures were unsuccessful. Ophryotrocha did not undergo any mortality during a short term 96 hour exposure. Long term (28 day) exposure decreased reproductivity at high concentrations of resuspended sediment. Lower concentrations of resuspended sediment produced a stimulatory effect on reproduction. Preliminary evidence suggests that harbor dredge spoils may have potential role as a 'sea fertilizer' which could be distributed in specified areas to improve the productivity of the marine environment. CAESIUM-137: ITS ACCUMULATION IN A LITTORAL COMMUNITY,
University of Manchester Inst. of Science and Technology (England). Pollution Research Unit.
M. J. Broom, P. D. Grimwood, and E. G. Bellinger.
Marine Pollution Bulletin, Vol. 6(2), 1975, p. 24-26, 2 tab., 1 fig., 21 ref.

Descriptors: *Cesium, *Radioactive waste disposal, *Demersal fish, *Commercial fish, *Marine fish, *Mussels, *Marine algae, Radioactive wastes, Radioecology, Radioisotopes, Marine animals, Mollusks, Aquatic plants, *Littoral, *Putassium, Path of pollutants, Water pollution effects.
Identifiers: *Windscale, *Caesium-137, *Irish Sea.

The low-level radioactive liquid wastes which arise at the U. K. nuclear fuel reprocessing plant at Windscale on the Cumbria coast are discharged into the Irish Sea. These wastes are initially dispersed but they can also become reconcentrated in marine organisms. Concentrations of 137-Cs relative to those of potassium in the various stages of marine food chains are described, discrimination occurs in favor of 137-Cs over potassium during the transfer between the different trophic levels. (Katz)

FIN EROSION IN WINTER FLOUNDER,
National Marine Fisheries Service, Highlands, N. J. Sandy Hook Sport Fisheries Marine Lab.
J. Ziskowski, and R. Murchellano.
Marine Pollution Bulletin, Vol. 6(2), 1975, p. 26-29, 1 tab, 3 fig, 9 ref.

Descriptors: *Marine fish, *Atlantic Ocean, *Fish diseases, Animal pathology, *Bottom fish, *Demersol fish, Commercial fish, Environmental effects, Fish physiology, Fish populations, *Epizootiology, Estuarine environment, Bays, On-site investigations, *New Jersey, Bays, Water pollution effects.
Identifiers: *New York Bight, *Great Bay(NJ), *Sandy Hook-Raritan Bay(NJ), *Fin erosion, *Winter flounders.

Diseased fish showing erosion of the fins have been recorded from polluted waters in several parts of the world. Results of a year's survey of fin erosion among fish in oceanic and estuarine waters of New York Bight are presented. The pristine Great Bay was chosen as a control for the heavily contaminated Sandy Hook-Raritan Bay system. Almost all fin erosion was confined to demersal flat fish, particularly the winter flounder, a species which spends a long time in polluted estuaries near Sandy Hook. (Katz)

EUTROPHICATION OF A PARTIALLY ENCLOSED ESTUARINE MUDFLAT,
National Inst. for Physical Planning and Construction Research, Dublin (Ireland).
E. Fahy, R. Goodwillie, J. Rochford, and D. Kelley.
Marine Pollution Bulletin, Vol. 6(2), 1975, p 29-31, 3 fig, 13 ref.

Descriptors: *Estuarine environment, *Bays, *Waterfowl, *Eutrophication, *Nutrients, *Tidal marshes, Intertidal areas, Water birds, Wildlife, Water pollution effects, Nitrogen, Phosphorous, Potassium, Distribution.
Identifiers: *Spartina, Biological mapping, *Dublin, *Ireland, *Rogerstown estuary(Ireland).

Some 130 years ago, a small estuary to the north of Dublin was partly cut off from the sea by a railway causeway. The mudflats that formed became an important feeding ground for wildfowl. In recent years the estuary has become subject to increasing organic pollution. Algal growth has increased and while the situation is not yet damaging to wildfowl, there is evidence that further increase in nutrients would cause undesirable extension of algal mats in the estuary. (Katz)

EFFECTS OF CRUDE OIL ON CORALS,
Pennsylvania State Univ., University Park.
A. A. Reimer.
Marine Pollution Bulletin, Vol. 6(3), 1975, p 39-43, 3 tab, 3 fig, 14 ref.

Descriptors: Oil, *Oil pollution, *Coral, *Reefs, *Toxicity, *Bioassays, Behavior, Animal behavior, Invertebrates, Atolls, Tropical regions, Aquatic habitat, Environmental effects, Mortality, Food habits, Water pollution effects.
Identifiers: *Reef communities, *Crude oil, Reef metabolism, Panamanian coral species, Crude oil, Bunker-C oil, Marine diesel oil, *Feeding response.

Corals are key members of the tropical reef communities, by providing habitat for other organisms and entering importantly into the overall metabolism of the reef community. Concern has been expressed several times at the collapse of the community that would result from damage to corals by oil pollution. So far relatively few experimental studies of the susceptibility of coral to oil have been carried out. In this study four Panamanian coral species have been exposed to marine diesel and bunker oil. These may cause delayed death, but probably more importantly interfere with feeding and metabolism at sub lethal concentrations. (Katz)
W76-11812

AROMATIC HYDROCARBONS AND THE GROWTH OF MARINE ALGAE,
Glasgow Univ. (Scotland). Dept. of Botany
A. D. Boney.
Marine Pollution Bulletin, Vol. 5, (12), 1974, p 185-186, 3 tab, 5 ref.

Descriptors: *Mortality, *Organic compounds, *Pathology, *Plant pathology, Toxicity, *Marine algae, *Marine sediments, Water pollution effects, *Aromatic compounds.
Identifiers: *Aromatic hydrocarbons, *Cancerous growths, *3,4-benzpyrene, *20-Methyl cholanthrene, *Carcinogens, *Carcinogenic activity, Tumor-like proliferations.

Aromatic compounds isolated from marine muds cause cancerous growths in certain seaweeds. In this study a number of aromatic hydrocarbons including some which are not yet reported as having carcinogenic activity have been found to stimulate growth of algae. (Katz)

INFLUENCE OF OIL ON NUCLEIC ACIDS OF ALGAE,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
I. A. Daravin, O. G. Mironov, and I. M. Tsimbal.
Marine Pollution Bulletin, Vol 6(1), 1975, p. 13-14, 6 tab., 10 ref.

Descriptors: *Oil pollution, *Oily water, *Oil spills, *Algae, Biochemistry, *Enzymes, *Metabolism, Energy conversion, Plant physiology, Plant growth, Regulations, Environmental effects, Plant pathology, Toxicity.
Identifiers: *Black Sea, *Petroleum hydrocarbons, Sub-lethal effects, DNA, RNA, Nucleic acids.

There is a fair amount of knowledge on the grosser effects of petroleum hydrocarbons on organisms, more subtle effects are still poorly known. This is particularly true of their influence on biologically active compounds. Studies on the effect of oil on DNA and RNA of some Black Sea algae suggest that it inhibits biosynthesis of these compounds and modifies the degree of polymerization of deoxyribonucleic acids. (Katz)
W76-11821

ELIMINATION OF HYDROCARBONS BY MUSSELS,
Instituto di Biologia del Mare, Venice (Italy).
V. U. Fossato.
Marine Pollution Bulletin, Vol. 6(1), 1975, p. 7-10, 1 tab., 2 fig., 17 ref.

Descriptors: *Oil pollution, *Oil spills, *Oily water, *Mussels, Biochemistry, *Degradation, Mollusks, Mytilus, Water pollution effects, Pathology, Environmental effects, Metabolism, Mode of action, Temperature.
Identifiers: *Hydrocarbon elimination, *Lagoon of Venice(Italy), Biological half-life, Aliphatic hydrocarbons, Mytilus galloprovincialis.

Mussels collected from hydrocarbon polluted areas of the Lagoon of Venice were transferred to the relatively unpolluted port entrance of Malamocco. Hydrocarbon elimination was quite rapid in the first 10-15 days but then slow and incomplete: 12% of the initial content persisted in the tissues for 8 weeks. Elimination of hydrocarbons was almost independent of water temperature between 7.5-26.00C but virtually ceased in one lot when the temperature abruptly dropped from about 11C to 4.5-6.0C. The biological half-life of hydrocarbons in the mussels was calculated to be a little over 3-1/2 days, but this relates only to the initial rapid phase of elimination. (Katz)

TEMPERATURE AND THE SEASONAL AND GEOGRAPHICAL OCCURRENCE OF OILED BIRDS ON WEST EUROPEAN BEACHES,
Aberdeen Univ. (Scotland). Seabird Group.
W. R. P. Bourne, and C. J. Bibby.
Marine Pollution Bulletin, Vol. 6(5), 1975, p. 77-80, 2 tab., 2 fig., 54 ref.

Descriptors: Environmental effects, *Mortality, *Oil-water interface, *Shore birds, *Aicides, *Seashores, *Coasts, Oil pollution, Oily water, Oil spills, Mortality, Water pollution effects, Non-game birds, Water birds, Gulls, Waterfowl, Wildlife, *Water temperature, Atlantic Ocean, Mediterranean Sea, *Seasonal.
Identifiers: *Oiled birds, Cold water temperatures, Tar balls, Solid residues, *Beached bird surveys.

Oiled birds appear to be a commoner aspect of oil pollution where it occurs with cold water temperatures, whereas the formation of tar-balls becomes more prominent with warm ones, possibly because liquid oil becomes reduced to inert solid residue comparatively harmless to birds more rapidly at higher temperatures. (Katz)
W76-11823

EFFECTIVENESS AND TOXICITY OF AN OIL DISPERSANT IN LARGE OUTDOOR SALT WATER TANKS,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia).
P. G. Wells, and P. D. Keizer.
Marine Pollution Bulletin, Vol. 6(10): 1975, p. 153-157, 3 tab., 2 fig., 18 ref.

Descriptors: *Oil spills, *Toxicity, *Bioassays, *Methodology, *Benthos, *Weathering, *Aging(Physical), Behavior, Oil pollution, Laboratory methods, Water pollution effects.
Identifiers: *Oil dispersant, *Oilsperse 43, *Venezuelan crude oil, *Green sea urchins, Weathered crude oil.

Use of the dispersant, Oilsperse 43, increased the dispersion of Venezuelan Guanipa crude oil. The resulting mixture was more homogeneous and the oil slick less viscous than in the oil tank. The dispersant appeared to retard formation of the familiar 'crust' on the surface. A weathered crude oil plus dispersant mixture with an oil concentration of 250 micrograms/l was lethal to over 50% of the test organisms, green sea urchins within 4 days. No mortalities occurred among urchins exposed to the crude oil treatment. (Katz)

A MODEL OF PATCHINESS FOR PREY-PREDATOR PLANKTON POPULATIONS,
Liege Univ. (Belgium) Institut of Mathematique.
D. M. Dubois.
Ecological Modelling (International Journal on Ecological Modelling and Engineering and Systems Ecology), Vol. 1, No. 1, p 67-80, May 1975. 3 fig, 22 ref.

Descriptors: *Aquatic environment, *Plankton, *Ecology, Mathematical models, Advection, Simulation analysis, Equations, Systems analysis, Aquatic populations.
Identifiers: *Ecological systems, *Spatial structuration, Nonlinear model, Turbulent sea, Ecological waves, Partial differential equation, Prey-predator populations.

A nonlinear model is proposed to explain the horizontal structuration of prey-predator populations in a turbulent sea. The model is represented by a system of partial differential equations taking into account advection, due to residual currents, and eddy diffusivity. The ecological interactions are assumed to be of the Lotka-Volterra type. Starting from an initial small patch of prey-predator populations, numerical simulations show two distinct phases: (1) an 'explosive' phase corresponding to a bloom of phytoplankton and, after that, (2) a decrease of the quantity of plankton at the center of the patch leading to a ring structure. The ring propagates in increasing its radius with constant intensity and velocity. The prey behaves like an 'activator' and the predator like an 'inhibitor'. The ring is thus similar to an active wave. When two waves meet each other, the simulation shows their 'annihilation'. All these new properties of the prey-predator equations are in agreement with experimental data. Finally, the physical mechanism for initiation of patchiness is discussed. (Bell-Cornell)

THE ROLE OF BENTHIC METABOLISM IN A BOG LAKE,
Connecticut Univ., Storrs. Inst. of Water Resources.
P. H. Rich.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-257 151, $3.50 in paper copy, $3.00 in microfiche. Completion Report, July 1976. 5 p, 1 fig, 5 ref. OWRT A-054-CONN (2) 14-31-0001-4007.

Descriptors: Eutrophication, Water pollution effects, *Lakes, *Lake sediments, *Metabolism, *Detritus, *Carbon cycle, Nutrients, *Trophic level, Ecosystems, Hypolimnion, Stratification, Bogs, Ponds, Carbon dioxide, Absorption, Oxygen sag, Anaerobic conditions, Organic matter, Photosynthesis, *Connecticut.
Identifiers: *Soft-water lake, *Benthic metabolism, Trophic dynamics, *Redox gradients, *Hypolimnetic oxygen deficit, Chemosynthesis, *Bacterial photosynthesis, Nutrient regulation, Alternate electron acceptors, *Dunham Pond(Conn).

A small, New England, soft-water lake accumulates more hypolimnetic CO2 during stratification than concomitant 02 uptake. Thus, benthic anaerobic metabolism is greater than benthic oxygen uptake estimates indicate, and energy-rich metabolic intermediates (alternate electron acceptors) are produced which may undergo deferred respiration (02 uptake) far from their origin (CO2 evolution). The energy released from these deferred transformations creates redox gradients, drives chemosynthesis and subsidizes bacterial photosynthesis in the water column. Because of the light limitation imposed by dissolved organic matter entering from the watershed, benthic respiration based largely upon terrestrial inputs, also, probably subsidizes the production of particulate organic carbon in the water column of Dunham Pond to a great extent. This pathway, which is important to the higher trophic levels of the lake, probably depends, in turn, upon a series of edaphic factors somewhat different than those thought to control algal production. (de Lara-Connecticut).

BENTHIC METABOLISM OF A SOFT-WATER LAKE,
Connecticut University, Storrs.
P. H. Rich.
Verh. Internat. Verin. Limnol., Vol. 19, p 1023-1028, October 1975. 3 fig, 2 tab, 7 ref. OWRT A-054-CONN (1) 14-31-0001-4007.

Descriptors: *Lakes, *Lake sediments, *Stratification, *Metabolism, *Chemical oxygen demand, *Carbon dioxide, *Dissolved oxygen, Ecosystems, *Connecticut.
Identifiers: *Soft-water lake, *Respiratory quotients, *Benthic metabolism, *Redox potential, *Alternate electron acceptors, *Dunham Pond(Conn).

Empirical respiratory quotients (RQ=C02/02) were obtained for Dunham Pond, a small, soft-water lake in the eastern crystalline highlands of Connecticut, by measuring the rates at which dissolved C02 (total) accumulated and dissolved 02 disappeared in the summer hypolimnion (below 2m) and beneath the ice in the winter. The data obtained from the hypolimnion during summer stratification indicate that more 02 than expected is taken up during the early part of stratification (negative C02 anomaly) and more C02 than expected is evolved during the latter part of stratification (positive C02 anomaly). Data obtained during winter (1973-74) stratification indicated some loss of identity of surface layers of water during a late January thaw, however, on a whole lake basis the same pattern of an early C02 anomaly and a later positive anomaly persisted. This cycle of unusual 02 uptake and C02 release suggests the uncoupling of oxidation from reduction in the sediments during most of the annual cycle and on a diurnal basis. Benthic respiratory quotients were found to increase with the duration of stratification, which suggests that RQ's are related to the redox potential and capacity of the sediments and not entirely to the composition of benthic organic matter. (de Lara-Connecticut)

A STUDY OF THE EFFECTS OF DETERGENTS ON TYPICAL BILGE WATERS AND CORRELATION OF OIL PARTICLE SIZES,
General Electric Co., Philadelphia, Pa. Re-Entry and Environmental Systems Div
E. Batutis, H. Hogue, and J. McGinn
Available from the National Technical Information Service, Springfield, Va 22161, as AD A020 172, $7.75 in paper copy, $3.00 in microfiche. U. S. Coast Guard Final Report No. USCG-D-177-75, July 1975. 222 p, numerous fig and ref. append. DOT-CG-43287.

Descriptors: *Water pollution, *Detergents, *Waste water disposal, *Oil pollution, *Emulsifiers, *Oily water, Particle size, Oil wastes, Water resources.
Identifiers: *Bilge water.

Oil removal systems for treating bilge water are drastically affected by the condition, composition and character of the incoming bilge water-oil mixture. The presence of various detergents and cleansers causes emulsification of hydrocarbon products already present. The extent of emulsification caused by synthetic detergents on eight oil was studied at a fixed agitation rate and intensity as a function of detergent type (cationic, anionic or non-ionic) and concentration as well as temperature, pH, and salinity of the continuous (external) phase (distilled water). Laboratory test emulsions were generated using ultrasonic agitation, coupled with high speed non-aerating dispersion to simulate the type of emulsions produced by the action of a centrifugal pump. A HIAC Particle Counter was used to determine the amount of oil emulsified. The conclusions indicated that: (1) Detergents with cationic-active ingredients would promote a higher degree of emulsification than those with non-ionic or anionic type surfactants. (2) The amount of oil emulsified under fixed agitation rate and intensity and fixed oil concentration does not increase proportionally with increasing detergent concentrations. (3) The concentration of emulsified oil tends to approach a nearly constant value with increasing detergent concentration. (4) At low concentrations of detergent, 100 ppm, the effect of some detergents seems to be one of de-emulsification. An appendix is included in this report covering a correlation of particle size data generated by a number of investigators. (Sinha - OEIS)
W76-11939

RELEASE OF DISSOLVED ORGANIC MATTER BY AUTOLYSIS OF A SUBMERSED MACROPHYTE, SCIRPUS SUBTERMINALIS,
National Inst. for the Environment, Tsukuba (Japan).
A. Otsuki, and R. G. Wetzel.
Limnol Oceanogr. 19(5), p 842-845, 1974.

Descriptors: Dissolved solids, *Organic matter Production, Primary productivity, Lakes, Carbon
Identifiers: *Autolysis, *Macrophytes, *Scirpus Subterminalis, Total organic carbon, Angiosperms, Oxic conditions, Anoxic conditions.

Of the net production of the submersed freshwater angiosperm S. subterminalis, 30-40% was released as dissolved organic matter on autolysis. Most of the autolytic organic matter was released within days under both oxic and anoxic conditions and represents a major source of total dissolved organic C to a hard water lake in which the plant dominates primary productivity.--Copyright 1976, Biological Abstracts, Inc.

ntifiers: Straits of Magellan, Tankers, Crude Mousse, Bunker C fuel oil, Environmental im-t.

August 9, 1974, the METULA, an oil tanker, aground on the Satellite Patch Shoal im-diately west of the First Narrows in the Straits Magellan. The initial spill of oil from the TULA was reported to be 6,000 tons. Sub-uent spills continued with the largest being 00 tons on August 19, until the total reported quantity of 51,5000 tons of crude oil and ap-ximately 2,000 tons of Bunker C fuel oil was hed. Over 128 kilometers or 80 miles of beach e evidence of oil impact. There appears to be tantial biological impact of the intertidal ne life, but the effect on other marine organ-is hard to determine. In the heavily oiled s, most adult mussels appear to be living, how-, an absence of very small or juvenile mussels noted. Changes in benthal worm populations algae were also noted. Further information on biological community will be available after atory studies of collected samples. The oil is still having a detrimental effect on marine rfowl and will continue to do so as long as un-lized oil or mousse is located at the top of the h zone and estuarine areas and as long as con-nated mussels are used as a food source. It evident from the study that there are other r sources of oil pollution in the Straits and the t of these chronic sources could ultimately e damaging to marine resources and most itely would make the proving of damages difficult in any future incident. EFFECTS OF POLLUTANTS ON THE IOUR OF THE BIVALVE TELLINA S,
Lab., Aberdeen (Scotland).
irling.

Marine Pollution Bulletin, Vol. 6 (8), 1975, p 122-124, 3 tab.

Descriptors: *Copper, *Bioassay, *Laboratory methods, Physiology, *Toxicity, *Behavior, *Metabolism, *Mollusks, *Phenols, *Industrial wastes, Clams, Methodology, Chemical wastes, Water pollution effects, Testing.
Identifiers: *Tellina tenuis, Burrowing behavior, Continuous flow bioassay.

Predictions of safe levels of effluent discharge have in the past been largely based on the results of short term acute toxicity tests (LC50s). Such tests are usually carried out in unnatural experimental conditions, and in consequence the results are of only limited value. There is a need to enlarge the concept of the routine bioassay test to include quantitative measurement of the effects of pollutants on behavior, physiology and metabolism. A simple rapid bioassay test is described in which the effect of pollutants on the burrowing of the bivalve Tellina tenuis has been used as a quantitative measure of pollutant effect. (Katz)

ARSENIC IN MARINE ORGANISMS FROM WEST GREENLAND,
B. C. Research Ltd., Vancouver.
A. Bohn.
Marine Pollution Bulletin, Vol. 6(6), 1975, p. 87-89, 2 tab, 12 ref.

Descriptors: *Arsenic compounds, *Marine animals, Marine fish, *Invertebrates, *Mussels, *Molluscs, Marine algae, *Crustaceans, *Zooplankton, *Marine plants, *Path of pollutants, Atlantic Ocean, Physiology, Trace elements, Metals, Water pollution effects.
Identifiers: *Trace metals, Background levels, *Greenland, Tissue metal content.

Natural background levels of trace metals in marine organisms from a West Greenland inlet were studied during the summer of 1972 and 1973. Dry weight arsenic levels ranged from 11.1 to 307 ppm in fish fillets and from 7.6 to 512 ppm in fish livers. Prawns had arsenic levels ranging up to 80.2 ppm, contrasting with 6.0 ppm in planktonic copepods. The results suggest that in certain marine organisms organo-arsenics predominate and are less toxic than inorganic arsenic compounds. (Katz)

CADMIUM LEVELS AND CARBOHYDRATE METABOLISM IN LIMPETS,
Bristol Polytechnic (England). Dept. of Science.
R. Shore, G. Carney, and T. Stygall.
Marine Pollution Bulletin, Vol. 6(12), 1975, p. 187-189, 1 tab, 3 fig, 12 ref.

Descriptors: *Cadmium, *Metals, *Pathology, *Metabolism, Biochemistry, *Mollusks, Physiology, Diets, Digestion, Benthos, Marine animals, Water pollution effects.
Identifiers: *Carbohydrate metabolism, *Limpets, Bristol channel, Glucose levels, Glucose metabolism, Cadmium levels, Glycolytic rate, Tissue cadmium concentration.

Limpets from several sites in the Bristol Channel exhibiting varying degrees of cadmium contamination have been studied. Investigations involved glucose levels and certain aspects of glucose metabolism. The results tentatively suggest that there may be a correlation between cadmium levels and reduced ability to utilize glucose. (Katz)

TRACE METAL CONTENT IN THE AMERICAN OYSTER,
National Marine Fisheries Service, Milford, Conn. Milford Lab.
R. A. Grieg, B. A. Nelson, and D. A. Nelson.
Marine Pollution Bulletin, Vol. 6(5), 1975, p. 72-73, 1 tab, 6 ref.

Descriptors: *Oysters, *Path of pollutants, Transfer, *Reproduction, Biology, *Gonads, Mollusks, *Cadmium, *Copper, Lead, Zinc, Fertility, Chemical analysis, *Connecticut, Marine animals, Water pollution effects, Path of pollutants, Estuarine environment.
Identifiers: *American oyster, *Oyster eggs, *Housatonic River(Conn), Silver.

Information about the transfer of pollutants from adult aquatic animals to their progeny is relatively scarce. This study was designed to measure the transfer of metals from adults to eggs of the American oyster. Two groups of oysters containing significantly different levels of copper and cadmium were induced to spawn, the eggs were collected and trace metal contents measured. The eggs from both groups of oysters contained the same amount of copper, while cadmium levels were below detectable limits in both groups of eggs. Silver, lead and zinc concentrations also were determined. The concentrations of these metals were similar for both groups of adults and eggs; thus, no conclusion could be made about the transfer of these three metals from adults to eggs of oysters. (Katz)

TOXICITY OF THREE OILS TO BIVALVE GAMETES AND LARVAE,
Siena Univ. (Italy). Inst. of Comparative Anatomy.
A. Renzoni.
Marine Pollution Bulletin, Vol. 6(8), 1975, p. 126-128, 3 tab, 1 fig, 13 ref.

Descriptors: Oil, *Oil pollution, *Toxicity, *Bioassay, *Mortality, *Mollusks, *Oysters, Laboratory animals, *Growth rates, *Immature growth stage, *Larval growth stage, Life cycle, Environmental effects, Larvae, Fertilization.
Identifiers: *Crude oil, Kuwait crude, Nigerian crude, Prudhoe Bay crude, Developmental abnormalities, Larval survival, Clam spermatozoa.

Water soluble extracts of three crude oils, Kuwait, Nigerian and Prudhoe Bay have been tested using the sperm and eggs of two marine bivalves. Fertilization is depressed and developmental abnormalities sometimes appear after exposure to these toxins. The spermatozoa, in particular, are very sensitive to the water-soluble fractions of these oils. Nigerian crude is particularly toxic. (Katz)
W76-11967

REDUCED GROWTH AND SURVIVAL OF CLAMS TRANSPLANTED TO AN OIL SPILL SITE,
Maine State Dept. of Marine Resources, Augusta.
R. L. Dow.
Marine Pollution Bulletin, Vol. 6(8): 1975, p. 124-125, 1 tab., 3 ref.

Descriptors: *Oil pollution, Environmental effects, Animal physiology, *Mortality, *Growth rates, *Animal growth, *Productivity, *Mudflats, Mollusks, Clams, Estuaries, Oil spills, Intertidal areas, Estuarine environment.

Identifiers: Soft shell clams, Polluted mud, Transplantation, Mya arenaria, Oil spill site.

Production of soft clams fell by 20% in two years following oil pollution although in adjacent mudflats production of them increased by 250%. Transplanting uncontaminated clams into this area confirmed poorer survival and slower growth in polluted mud. (Katz)
W76-11968

HINDGUT MICROFLORA FROM OIL-POLLUTED SOFT-SHELL CLAMS,
Rhode Island Univ., Kingston. Dept. of Plant Pathology-Entomology.
A. M. Cundell, and R. R. Young.
Marine Pollution Bulletin, Vol. 6(9), 1975, p. 134-135. 2 tab.

Descriptors: *Mollusks, Oil, *Oil pollution, Microbiology, *Clams, *Digestion, Metabolism, *Biodegradation, *Aquatic microorganisms, Sediments, Physiology, Animal physiology, Water pollution effects, Estuarine environment, Bays, Rhode Island.
Identifiers: Soft-Shell Clams, Mya Arenaria, Hindgut microflora, Narragansett Bay(RI).

The natural microflora resident in the hindgut of the soft-shell clam Mya arenaria appear to have no role in the biodegradation of petroleum hydrocarbons in oil-polluted estuarine sediments. (Katz)
W76-11969

DISTRIBUTION AND ABUNDANCE OF THE POLYCHAETOUS ANNELIDS IN A SOUTH FLORIDA ESTUARY,
University of South Florida, Tampa. Dept. of Biology.
S. L. Santos, and J. L. Simon.
Bull Mar Sci. 24(3), p 669-689, 1974.

Descriptors: *Florida, Estuaries, *Annelids, Distribution, Vegetation, Estuarine environment.
Identifiers: Diplanthera-Wrightii, Onuphis-Eremita-Oculata, Polychaetous annelids, Thalassia-Testudinum, *Polychaetes.

This distribution and abundance of polychaetous annelids in a subtropical estuarine environment were investigated. The area contained zones of Thalassia testudinum, Diplanthera wrightii, and sand. Quarterly samples were taken from stations established within all zones. No seasonal differences in particle size distribution of sediment were found. The Thalassia zone supports the largest number of organisms. Onuphis eremita oculata was the dominant polychaete. Czekanowski's coefficient and group average sorting were used to determine relationships among the fauna from each zone. Information statistic tests were utilized to delineate classes. Different assemblages of polychaetes were not associated with different vegetative zones. The densities of the individual species from the one assemblage present in Lassing Park, St. Petersburg, Florida, varied by season and by zone.--Copyright 1975, Biological Abstracts, Inc.

CARBON-13 ENRICHED CARBONATE IN INTERSTITIAL WATERS OF LAKE KINNERET SEDIMENTS,
Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Isotope Research.
M. Stiller, and M. Magaritz.
Limnol Oceanogr. 19(5), p 849-852, 1974.

Descriptors: *Lake sediments, *Carbonates, Connate water, *Dissolved solids, Lakes, Asia, Alkalinity, *Calcite, Decomposing organic matter, Anaerobic conditions, Calcium carbonate.
Identifiers: Carbon-13, *Lake Kinneret(Israel).

Dissolved carbonates in interstitial waters of Lake Kinneret sediments (Galilee, Israel) are enriched in 13C by 10-20% over the dissolved carbonate in the lake water. The increase of alkalinity which accompanies this enrichment indicates in situ formation of dissolved carbonate. The interstitial waters are slightly undersaturated in respect to calcite, but dissolution of CaCO3 cannot explain the enriched 13C values. The enrichment of 13C in the pore water carbonate is probably related to the anaerobic decomposition of organic matter in the sediments.--Copyright 1975, Biological Abstracts, Inc.

5D. Waste Treatment Processes

WATER POLLUTION CONTROL: CROSSROADS OF A MUNICIPAL FINANCIAL DILEMMA,
North Texas State Univ., Denton. Dept. of Administrative Sciences and Marketing.
F. P. Williams, and A. C. Rucks.
Public Works, Vol. 107, No. 6, p 86-88, June, 1976. 1 fig, 1 tab, 21 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Analytical techniques, *Water pollution control, *Financing, Local governments, Economics, Decision making.

Financial and economic considerations are needed in environmental decision making. The discussion includes the amount of financing required by municipalities, the goals of the Water Pollution Control Act Amendments of 1972, some alternative financial resources available to municipalities, and the need for careful evaluation of these alternatives. The Environmental Protection Agency (EPA) estimated, via the 1974 'Needs Survey,' that municipalities will require an investment of $114.6 billion in waste treatment facilities to accommodate urban populations in 1990. The per capita costs were estimated at $549 in 1972 and $464 in 1990. Adjusted estimates are $1,500 per capita in 1972 and $1,265 per capita in 1990. The traditional methods of financing municipal projects such as waste water treatment include property taxes, user charges, special assessments and bond issues. The EPA also provides waste treatment construction grants. Cities have encountered difficulties, however, in obtaining these funds. It has also been reported that some states are penalized with respect to funds because their cities have been more effective than others in applying advanced waste treatment technology. The effects on individual cities of alternative forms of financing should be analyzed. The analysis should include cost estimates for achieving national water quality goals, an appraisal of the ability of internal sources of funds to meet these costs and the extent to which external sources will be needed, and an appraisal of the per capita impact of using alternative sources of funds. (Snyder-FIRL)
W76-11626

ODOUR CONTROL AT TORONTO'S ASH BRIDGES BAY TREATMENT PLANT.
Water and Pollution Control, Vol. 114, No. 6, p 40-41, June, 1976. 1 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, Odor, Control, Incineration, Screens, Ozone, Oxidation lagoons, *Canada.
Identifiers: Aeration tanks, Aerated grit tanks, Primary tanks, Scrubbers, *Odor control.

Odor control facilities are being installed in three municipal sewage treatment plants in Toronto. Major sources of the odors at the Main Treatment Plant, Ashbridge Bay, were found to be the aeration tanks, multi-hearth incinerators, aerated grit tanks and screens, and primary tanks. The aeration tank odors, consisting of normal spent diffused air plus ventilated air from the covered primary tanks, will be eliminated by ozonation, followed by wet scrubbing. With this system, any odors not oxidized by ozonation will be oxidized in the cross flow scrubbers. The level of ozone in the discharged air, after scrubbing, will be below the 0.08 ppm limits required by law. A detailed description of the system is provided, including the axial fans to discharge emission air, measurement instrumentation for ozone pressure and concentration, and process automation facilities. ALTERATION OF MICROBIAL POPULATIO IN THERMAL STRESS,
Texas Univ. Health Science Center, Houst School of Public Health.
R. K. Guthrie, D. S. Cherry, and F. L. Singleton
Journal Water Pollution Control Federation, V 48, No. 5, p 962-965, May, 1976. 3 fig, 7 ref.

Descriptors: *Waste water treatment, *Biologi treatment, *Thermal stress, *Bacteria, *E c Municipal wastes, Pathogenic bacteria, Ent bacteria, Coliforms, Streptococcus, Salmone Evaluation.

The hypothesis that thermal loading to 31 C waste water effluent to which Flavo-bacterium tescens is added increases the die-off rates Escherichia coli, Streptococcus faecalis, and

eric pathogen Salmonella typhimurium was ted. In laboratory tests using municipal waste ter containing Flavobacterium lutescens and ted to 31 C, Streptococcus faecalis counts ained stable for 2 weeks and then dropped to by day 20. Escherichia coli counts remained stant for 1 week and then declined gradually to on day 14. Salmonella typhimurium counts ained stable for 2 weeks at 31 C before a rapid line began, and no colonies were detected by 30. The results indicate that the use of a natu- occurring aquatic bacterial species in com- tion with thermal stress offers a potential con- of undesirable or pathogenic bacterial con- nants in aquatic systems. HORUS TRANSPORT IN A PACKED ACTOR,
Univ., Gainesville. Dept. of Agricultural ring.
erman, R-L. Chu, and W. G. Leseman.
Water Pollution Control Federation, Vol. , p 880-888, May, 1976. 11 fig, 11 ref.

Descriptors: *Packed beds, *Model studies, *Tertiary treatment, *Waste water treatment, *Phosphorus, Chemical reactions, Dispersion, Adsorption, Convection, Flow rates, Municipal wastes, Irrigation, Mathematical models.
Identifiers: Fixed bed reactors.

A dispersed flow model of phosphorus transport in a packed bed reactor (soil) was developed to gain information on the fate of this nutrient in advanced waste treatment processes handling municipal waste water. The model adequately described both transient response and steady-state distributions and showed that the processes of dispersion, convection, chemical reaction, and adsorption are relevant to transport. Transport coefficients of dispersion, reaction, and adsorption were found sensitive to pore velocity (flow rate); this apparently was due to the treatment of a heterogeneous reactor as an equivalent homogeneous reactor for the purpose of providing a transport equation amenable to mathematical solution. The usefulness of the model is not particularly limited by this approximation. Phosphorus measurements from a field under irrigation with municipal waste water (fixed bed reactor) exhibited a steady-state distribution which closely agreed with that of the laboratory model (packed bed reactor). (Kreager-FIRL)
W76-11632

MOST PROBABLE NUMBER VERSUS MEMBRANE FILTER ON CHLORINATED EFFLUENTS,
Rockland County Sewage Treatment Plant, Orangeburg, N. Y.
A. Mowat.
Journal Water Pollution Control Federation, Vol. 48, No. 4, p 724-728, April, 1976. 3 tab, 4 ref.

Descriptors: *Coliforms, *Analytical techniques, *Sewage treatment, *Treatment facilities, *Chlorination, *Quality control, Statistics, Evaluation, Microorganisms, Bacteria, Waste treatment, Effluents, Measurement, Membrane processes, *Pollutant identification.
Identifiers: Most probable number technique.

A total of 25 experiments were conducted at a sewage treatment plant using the activated sludge process to compare the results obtained by the most probable number and membrane filter techniques for total coliform determination on chlorinated and unchlorinated secondary effluent. Great discrepancies between the two methods were observed for unchlorinated effluent, whereas good correspondence between the two techniques was obtained for chlorinated secondary effluent, especially at bacterial densities below 1000. Samples with 30-minute chlorination times yielded better agreement between the two techniques than did samples with only 15-minue chlorination times. This may indicate that the longer chlorination time effected a good kill of the bacteria, while the shorter chlorination time was only partially effective, allowing recovery of the bacteria under favorable conditions. The discrepancy between the two methods for unchlorinated samples remains unexplained. (Kreager-FIRL)
W76-11635

EPA GUIDANCE AND POLICY ON LAND TREATMENT,
Environmental Protection Agency, Washington, D. C. Office of Water Programs.
J. T. Rhett.
In: Land Application of Wastewater, November 20-21, 1974, Newark, Delaware, p 1-2.

Descriptors: *Waste water treatment, *Waste water disposal, *Federal jurisdiction, *Land use, Legislation, Financing, Economics, Groundwater.
Identifiers: *Land application.

Environmental Protection Agency policies on waste water treatment and disposal are reviewed, with particular emphasis on land treatment. An agency document entitled 'Alternative Waste Management Techniques for Best Practicable Waste Treatment' identifies currently known techniques for meeting the requirements of the Water Pollution Control Act Amendments. The choice of which alternative to adopt is left to each municipality or regional sanitary district; however, if an area receives federal funds, it must be guided by the Agency's cost effectiveness regulations. Any land application or land utilization techniques considered must comply with criteria designed to protect groundwaters in order to qualify for federal funding. The deputy administrator of the Environmental Protection Agency has indicated that land treatment may be used in lieu of other systems of waste management if it can be demonstrated land treatment is the most cost effective alternative, is consistent with the environmental assessment, and satisfies applicable tests. (See also W76-11231) (Kreager-FIRL)
W76-11638

PUBLIC HEALTH ASPECTS OF LAND APPLICATION OF WASTEWATER EFFLUENTS,
Army Medical Bioengineering Research and Development Lab., Fort Detrick, Md.
C. A. Sorber.
In: Land Application of Wastewater, November 20-21, 1974, Newark, Delaware, p 27-33. 7 tab, 18 ref.

Descriptors: *Overland flow, *Infiltration, *Irrigation, *Public health, *Waste water treatment, Pathogenic bacteria, Sodium, Ions, Nitrates, Ponding, Mosquitoes, Diseases, Dissolved solids, Potable water, Municipal wastes, Aerosols.
Identifiers: *Land application.

Waste water treatment involving such land application methods as overland flow, rapid infiltration, and spray irrigation is discussed in terms of its public health impacts. In general, potential health and environmental problems can be minimized by proper waste water treatment and proper site selection. Problems that may be encountered include pathogenic aerosols near spray sites, the enhancement of mosquito breeding at ponding sites, and the presence of sodium and nitrate ions as well as total dissolved solids where waste water recycle is practiced. High sodium contents may be harmful to individuals suffering from cardiac, renal, and circulatory diseases. The nitrate ion is the causative agent of methemoglobinemia in children, and a concentration of no more than 10 mg/liter for nitrate-nitrogen is recommended for drinking water supplies. Pathogens in waste water represent one of the major potential health problems associated with recycling municipal waste water on the land. (See also W76-11231) (Kreager-FIRL)

THE ENVIRONMENTAL AND SOCIOLOGICAL IMPACT OF RECYCLING OF AGRICULTURAL WASTE BY LAND USE,
Green Valley Farms, Avondale, Pa.
B. J. Reynolds.
In: Land Application of Wastewater, November 20-21, 1974, Newark, Delaware, p 53-57. 2 ref.

Descriptors: *Irrigation, *Waste treatment, *Recycling, *Waste disposal, *Farm wastes, Stabilization, Ponding, Effluents, Ammonia, Coliforms, Phosphates, Bacteria, Biochemical oxygen demand, Crop production, Social aspects, On-site investigations.

The results of an experimental agricultural waste recycling program being conducted at the Green Valley Farms in New Garden Township, Pennsylvania are presented. The basic raw material being recycled is manure effluent discharged by 200 head of milking cows into two stabilization ponds. The effluent is composed of the manure and urine excreted by the animals, wash water for cleaning the concrete pads, and milkhouse and milking parlor wastes. The biologically treated effluent is applied to crops and woodlands by a spray irrigation system. As a result of the growth of the crops and woodlands, the following waste removals are observed: 99.6% of the ammonia in the treated effluent (there is no nitrate in the stabilization ponds), 99.6% of the phosphates, 5-day biochemical oxygen demand, and total as well as fecal coliform. Waste recycling on the farm has resulted in a doubling of corn production, a tripling of soybean production, and large increases in both the tonnage and protein content of grasses. The community response to the land treatment program has been very favorable. (See also W76-11231) (Kreager-FIRL)
W76-11641

EXPERIENCE WITH LAND APPLICATION OF WASTEWATER AND STATE REGULATIONS - THE PENNYPACK WATERSHED,
Martin (A. W.) Associates, Inc., King of Prussia, Pa.
G. H. Emrich.
In: Land Application of Wastewater, November 20-21, 1974, Newark, Delaware, p 69-63. 6 fig.

Descriptors: *Irrigation, *Waste water disposal, *Recycling, *Water management(Applied), *Water supply, Groundwater, Surface waters, Watersheds(Basins), Wells, Waste treatment, Regulation, *Pennsylvania.
Identifiers: *Land application, Pennyback watershed(Penn).

The water balance for the Pennypack Watershed is analyzed, and spray irrigation of waste water is concluded to be the most cost-effective waste treatment option for the area. The watershed is capable of accepting up to 4.5 million gallons/day or 1.5 billion gallons/year of treated waste water. This could create a significantly desirable effect on the base flow in the streams and tributaries near the spray areas or could be developed as a groundwater supply. Assuming that 2 in/week of treated waste water (the maximum permitted in Pennsylvania) is spray irrigated onto a site and assuming 80% infiltration, 83 in. of additional water is added to the groundwater reservoir each year. It also is possible to selectively develop water well fields which are contiguous with the spray irrigation fields, thus enabling the recapture of an estimated 50% of the spray irrigated water for public water supply use. The remaining 50% would supplement the base flow in nearby streams. (See also W76-11231) (Kreager-FIRL)
W76-11642

EXPERIENCE WITH LAND APPLICATION OF WASTEWATER AND STATE REGULATIONS - PENNYPACK WATERSHED-PENNSYLVANIA,
Pennypack Watershed Association, Bryn Athyn, Pa.
F. U. Pitcairn.
In: Land Application of Wastewater, November 20-21, 1974, Newark, Delaware, p 65-67. 3 ref.

Descriptors: *Irrigation, *Water management(Applied), *Waste water disposal, *Sewage treatment, *Recycling, *Water supply, Groundwater, Surface waters, Watersheds(Basins), Waste water treatment, Costs, Regulation, Legislation, Land use, Regional development, *Pennsylvania.
Identifiers: *Land application, Pennyback watershed(Penn).

Water quantity management for the Pennypack Watershed in Pennsylvania is discussed in terms of existing state legislation and the desirability of applying secondarily treated sewage to the land via spray irrigation. The only plan now in existence for the watershed are 10-year plans for sewage facilities in accord with the provisions of the Pennsylvania Sewage Facilities Act. These plans are piecemeal, fragmented attempts to solve short-term problems, with little attention devoted to long-term, regional water management. The Pennypack Watershed Association has identified more than 600 acres of land eminently suited for spray irrigation; these lands could handle up to 4 million gallons/day of secondarily treated sewage. Spray irrigation is capable of recharging the groundwater supply, maintaining the watershed's water balance, augmenting stream flows, minimizing water pollution, and reducing water treatment costs by obviating the necessity for tertiary treatment. (See also W76-11231) (Kreager-FIRL)

LAND DISPOSAL OF WASTEWATER IN THE COMMONWEALTH OF PENNSYLVANIA - A REGULATORY VIEW,
Pennsylvania Department of Environmental Resources, Harrisburg. Burea of Water Quality Management.
S. F. Curran, Jr.
In: Land Application of Wastewater, November 20-21, 1974, Newark, Delaware, p 69-70. 3 ref.

Descriptors: *Irrigation, *Waste water disposal, *Waste water treatment, *Recycling, *Regulation, *State jurisdiction, *Pennsylvania, Water management(Applied), Sites, Groundwater, Treatment.
Identifiers: *Land application.

Waste water disposal via spray irrigation in the Commonwealth of Pennsylvania is discussed from a regulatory point of view. Since large amounts of waste water discharged to the land surface infiltrate and recharge groundwater, all spray irrigation installations in Pennsylvania are considered as discharges to the waters. Spray irrigation should be used only in situations where the waste water contains materials that can be renovated in the soil mantle and do not pollute groundwater. Generally, the equivalent of secondary treatment must precede the irrigation. The Pennsylvania Department of Environmental Resources makes allowances for variability of earth materials, spray field use, and effluent constituents in reviewing installation proposals on a site by site basis. The prime consideration for site selection is the ability of the organic and earth materials to properly treat the waste water. (See also W76-11231) (Kreager-FIRL)

COMPUTER AIDED PLANNING OF A REGIONAL DISPOSAL SYSTEM FOR MUNICIPAL SLUDGE,
B and P Engineers, Kitchener (Ontario).
F. J. Allan, P. L. Silveston, W. L. Keay, and E. R. Simonen.
In: Annual Conference Proceedings of the Ontari Section of the American Water Works Associa tion, Pollution Control Association of Ontario, an Ontario Municipal Water Association. April 20-2 1975, Toronto, Ontario, p 115-135. 10 fig, 4 tab

Descriptors: *Sludge disposal, *Computer pro grams, *Cost analysis, *Regional analysis, M nicipal wastes, Waste disposal, Treatment faci ties, Planning, Economics, Regional developmen

A computer program for planning the region disposal of municipal sludge is described. The pr gram is capable of searching numerous altern tives which exist between the two extremes of centralized facility serving all sludge sources and decentralized disposal system with a dispos system for each sludge source. The computer pr gram divides sludge disposal planning into thr interacting sub-problems: facility planning, alloc tion of sludge to the facilities, and sludge transpo planning. The planner submits several locatio and types of facilities to the computer whi searches for the most economic system. A u training manual which provides information data sources and set-up procedures is also avai ble. (See also W76-11249) (Kreager-FIRL)

SOLID WASTE, SEWAGE, AND ENERGY - A SYMBIOTIC APPROACH,
Energy Management Group, New York.
J. C. Dale.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 35-36.

Descriptors: *Water reuse, *Recycling, *Waste water treatment, *Cities, Water supply, Industrial wastes, Municipal wastes, Sewage, Water utilization, Fuels.

The potential benefits of using a symbiotic approach to solve problems associated with the generation of municipal and industrial solid wastes and sewage, industrial water supply needs, and fuel shortages are discussed. A hypothetical example involving a city with a population of 100,000 is used to show that waste garbage, sewage, and animal wastes can be used for producing gas fuel for industrial needs and char which can be used as filter media for tertiary treatment at a sewage treatment plant. The treated sewage effluent can then be reused for industrial purposes not requiring potable water. (See also W76-11257) (Kreager-FIRL)

THE U. S. ENVIRONMENTAL PROTECTION AGENCY: PAST AND FUTURE CHALLENGES,
Environmental Protection Agency, Washington, D. C.
R. E. Train.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 43-45.

Descriptors: *Water reuse, *Recycling, *Symbiosis, *Municipal wastes, *Waste water, Irrigation, Reclamation, Reclaimed water, Recreation facilities, Lakes, Industrial water, Research and development, Government supports, Government finance, Organizations, Treatment facilities.
Identifiers: *Environmental Protection Agency.

Environmental Protection Agency activities in the areas of waste water treatment and water reuse are reviewed along with future challenges in these areas. Since the establishment of the Agency, it has committed almost $11 billion in grants to states and communities for the construction of waste water treatment plants. The Agency has put strong emphasis on research and development activities associated with water reuse. The reuse of municipal waste water is currently being practiced on a continuing basis in 358 locations throughout the United States, chiefly in the semi-arid southwestern states. Principal applications for waste water reuse include irrigation and landscaping, industrial cooling and processing water utilization, and recreational lake maintenance. The present reuse of waste water, however, is small in relation to the amount of municipal waste water being generated, and expanded practice and continued development of municipal waste water reclamation is required. A COMPUTER BASED OPERATIONAL STRATEGY FOR THE JOINT TREATMENT OF MUNICIPAL AND INDUSTRIAL WASTE-WATERS,
Houston Univ., Tex.
J. F. Andrews, and G. Olsson.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 60-64. 2 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Municipal wastes, *Computer programs, *Model studies, *Simulation analysis, Treatment facilities, Biological treatment, Control systems.
Identifiers: Municipal-industrial wastes treatment, *Combined treatment.

A computer-based strategy for the combined treatment of municipal and industrial waste water is described which overcomes problems associated with the detrimental effects of certain industrial wastes on biological treatment processes. The basis of the strategy is the scheduling of batch dumps of industrial wastes so that they arrive at the treatment plant relatively unmixed with other waste water. This can be accomplished by real-time computer simulations using a dynamic model of the sewerage system. The discharge of batch industrial wastes to municipal sewers are timed in such a manner that their transport to combined treatment plants occurs when the municipal waste water flow rate is at its lowest. Upon arrival at the treatment plant, the mixture of waste waters can be diverted to a variable volume holding tank and then, depending on the characteristics of the industrial waste, be bled into the biological process over the full 24-hour period or treated by physical and/or chemical processes prior to discharge into the biological process for further treatment. PROJECT CURE,
Environmental Protection Agency, Cincinnati, Ohio.
D. G. Stephan.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 286-289. 1 tab, 3 ref.

Descriptors: *Waste water treatment, *Tertiary treatment, *Surface waters, *Water management(Applied), *Reclamation, *Recreation facilities, *Rivers, Channels, Lakes, Impounded waters, Artificial watercourses.

Project CURE (Clean Urban River Environments), a research proposal prepared in 1969 jointly by the Mid-Continent region of the Bureau of Outdoor Recreation and the Missouri Basin of the Federal Water Pollution Control Administration, is described. The proposed project involves the advanced treatment of waste water very near its points of use and collection followed by releases of the highly treated effluent into either natural or specially created channels and impoundments. The objective of the project is to create newly-formed rivers and lakes for water-oriented outdoor recreation and for the enhancement of the urban environment. Treatment plants are expected to be relatively small and located in or near homogeneous suburban areas at the fringes of the city. The additional costs associated with the construction of such treatment facilities are expected to be somewhat offset by the fact that extensive sewers will be unnecessary. Existing sewers could be utilized for transporting storm water runoff, and existing treatment plants could likewise be used for treating storm water runoff, thus increasing the overall quality of treated water. LOWER WALLER CREEK MASTER IMPROVEMENT PLAN,
Taniguchi, Shefelman, Vackar, and Minter, Austin, Tex.
T. W. Shefelman, and A. H. Ullrich.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 305-309.

Descriptors: *Water management(Applied), *Floodproofing, *Waste water treatment, *Streams, *Cities, Surface waters, Groundwater, Monitoring, Land use, *Texas, Planning.

Identifiers: Waller Creek(Tex).

A plan for improving the flow and flooding characteristics as well as water quality is proposed for lower Waller Creek which runs through the economically depressed eastern edge of the central business district in Austin, Texas. Methods being considered for supplementing flow include: drilling wells in the drainage area and discharging pumped groundwater into the channel, pumping town lake water to some upstream point and discharging it into the channel, and operating the existing municipal swimming pools in the drainage area on a flow-through basis for discharge into the creek channel. Concepts for flood control being considered include: upstream flood retarding structures, channel modifications, relocations of man-made obstacles, and flood water bypasses around bridges and possibly other channel restrictions. Plans for improving the water quality include: storm water treatment; dry weather flow water treatment; the monitoring of flows from storm sewers, gutters, and surface drains; and the pumping of town lake water for discharge into the creek at upstream points. Land use and development plans for the area are also being considered. (See also W76-11257) (Kreager-FIRL)
W76-11662

SOURCES AND POTENTIAL USES OF SALVAGEABLE WATERS IN ARIZONA URBAN REGIONS,
Arizona Water Resources Research Center, Tucson.
K. J. DeCook.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 310-319. 5 tab, 12 ref.

Descriptors: *Water reuse, *Reclaimed water, *Water management(Applied), *Cities, *Deserts, Groundwater recharge, Floodproofing, Surface waters, Irrigation, Sewage treatment, Fertilizers, Nutrients, Nitrogen, Industrial wastes, Recreation facilities, *Arizona.

Symbiotic relationships which are implicit in the occurrence and potential use of salvageable waters in the desert urban environments of Phoenix and Tucson, Arizona are discussed. Treated sewage effluent can be used for crop irrigation and as a source of nitrogen for cropped lands. Satellite waste water treatment plants located in urban regional parks can relieve local overloading of the sewage collection systems and simultaneously provide a source of usable water to supplement park water requirements. Power plant blowdown can be used for groundwater recharge and irrigation of landscaped areas. The diversion of short-term peak flood flows from small urban watersheds can reduce flood danger as well as the construction cost of hydraulic structures downstream while providing supplementary water supplies for turf irrigation or recreation parks adjoining the watercourse. EVALUATION OF TOXICITIES AND ENVIRONMENTAL IMPACT IN 'SYMBIOTIC' WATER REUSE SYSTEMS,
M. P. Kraus.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 476-482. 6 tab, 4 ref.

Descriptors: *Viruses, *Toxicity, *Waste water treatment, *Water reuse, *Reclaimed water, *Bioassay, Sewage, Sludge, Irrigation, Oxidation lagoons, Sludge disposal, Sludge treatment, Radiation, Waste treatment, *Pollutant identification, Algae.

Viral assay data for various symbiotic water reuse systems are reviewed. Assays of water samples from a variety of oxidation lagoons revealed great variations in virus counts, with zero counts almost never being observed. Studies of soil treatment of dairy barn wastes showed appreciable virus removals, though the condition of the removed viruses was not determined. Considerable alteration in virus population was observed as a result of spray irrigation of domestic sewage onto woodland, with host-range, plaque-morphology patterns being significantly different than those of sewage samples. Viruses were found to abound in sludge disposed of on land, including digested or heat-treated sludge. The use of ionizing radiation for destroying viruses in sludges, treated sewage, and lagooned wastes suitable for use in certain chemical processes was also investigated, and it appears possible to regulate doses so that satisfactory treatment can be provided in some cases. However, certain strains of bluegreen algae carrying latent viruses have not proved inducible and remain very resistant to large doses of radiation. (See also W76-11257) (Kreager-FIRL)
W76-11665

DEVELOPMENT OF INSTRUMENTATION FOR A WATER PROCESSING ELEMENT,
Life Systems, Inc., Cleveland, Ohio.
G. G. See, P. Y. Yang, and R. A. Wynveen.
In: 3rd National Conference on Complete WateReuse June 27-30, 1976, Cincinnati, Ohio, p 491-501. 15 fig, 4 tab, 5 ref.

Descriptors: *Waste water treatment, *Water reuse, *Desalination, *Instrumentation, *Equipment, Reverse osmosis, Ozone, Chlorination, Oxidation, Filtration, Ion exchange, Design criteria, Potable water, Brackish water, Monitoring, Control systems.

A water processing element designed for use with transportable Army hospital is described, with particular emphasis on the instrumentation aspects of the system. The water processing element is capable of treating and disposing hospital waste water, producing water for reuse from waste water, and desalting brackish water for potable uses. The unit consists of six separate processes with control and monitoring instrumentation: equalization/prescreening, ultrafiltration, ion exchange, reverse osmosis, ozone oxidation, and hypochlorination. A discussion of instrumentation developments and approaches to the design of instrumentation is presented along with an example of the detailed instrumentation design of the ozone oxidation unit process. IRRIGATION OF LEASED FARMLAND WITH TREATED WASTEWATER,
Hickok (Eugene A) and Associates, Wayzata, Minn.
N. C. Wenck, M. C. Hannaman, and R. F. Roskopf.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 578-593. 13 fig, 13 tab.

Descriptors: *Water reuse, *Waste water, *Irrigation, Farms, *Recycling, Crop production, Groundwater, Water quality, Water conservation, Odor, Evaluation, Chlorides.

The results from a one-year pilot study involving the irrigation of farmland with treated waste water are presented. A total of 8.2 inches of waste water was applied to the study site in six different irrigation runs and crop samples were obtained from both irrigated and nonirrigated areas. The irrigation resulted in an increase in corn yield of 28 bushes/acre. Based on soil moisture and consumption use data, a design application rate of 12 inches/year appears feasible. The irrigation did not affect groundwater levels in the area and with the exception of chlorides, no changes in groundwater quality were detected. Chloride contamination did not appear to be serious. No complaints of odor were received from surrounding residents during the irrigation season. (See also W76-11257) (Kreager-FIRL)
W76-11667

BENEFICIAL USE OF INDUSTRIAL WASTES IN MUNICIPAL WASTEWATER TREATMENT PLANTS,
Greeley and Hansen, Chicago, Ill.
T. E. Wilson.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 594-598. 3 fig, 3 tab, 14 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Organic compounds, *Metals, *Acids, Sludge treatment, Suspended solids, Biochemical oxygen demand, Heavy metals, Biological treatment, Denitrification, Chemical oxygen demand, Nitrogen, Byproducts, Treatment facilities, Phosphorus.
Identifiers: Municipal-industrial wastes.

Industrial wastes which can be used for beneficial purpose in municipal waste water treatment plants are discussed. Metal-acid wastes from industrial operations can be used for phosphorus removal, sludge conditioning, and a general improvement in suspended solids removal and biochemical oxygen demand removal in municipal waste water treatment operations. In general, the metal-acid waste should have a relatively high iron or aluminum content (about 5 and 2.5%, respectively). High concentrations of heavy metals in metal-acid wastes, however, may render these wastes unsuitable for the above purposes. High strength organic industrial wastes can be used to replace expensive raw chemicals used in biological denitrification processes. The organic waste should be preferably concentrated, with a soluble chemical oxygen demand as high as possible (over 50,000 mg/liter). The organic waste must also contain very little nitrogen. Specific examples of the use of each type of waste in waste water treatment applications are cited. (See also W76-11257) (Kreager-FIRL)
W76-11668

IRRIGATION WITH CITRUS WASTE WATER,
Agricultural Research and Education Center, Lake Alfred, Fla.
R. C. J. Koo.
The Citrus Industry, Vol. 55, No. 5, p 12, 17-19, May, 1974. 3 tab, 8 ref. OWRT A-016-FLA (4)

Descriptors: *Waste water treatment, *Industrial wastes, *Food processing industry, Citrus fruits, Irrigation, Waste water disposal, Agriculture, Fertilization, Nitrogen, Biochemical oxygen demand, Water reuse, *Florida.

To test the effects of citrus processing plant waste water on citrus trees several citrus scion-rootstock combinations were grown in a greenhouse for three years with treated waste water from two citrus processing plants in central Florida. No harmful effects were observed from the use of treated citrus waste water. Supplemental fertilization was required to sustain the trees, as the treated citrus waste water was low in nutrients. Observations of young and mature citrus trees irrigated with untreated waste water under field conditions indicated that quantity was more critical than quality of the waste water applied. Cultural practices in the grove should be modified to compensate for the change from a natural enviro

ıent. Soil in the citrus grove serves as a filtering ystem for the waste water. A marked reduction in ıe BOD, COD, and N contents were observed as ıe waste water percolated through the soil profile. he results were similar to those obtained by the eration of citrus waste water. (Murphy-FIRL)

EVALUATION OF SOIL SYSTEMS FOR LAND DISPOSAL OF INDUSTRIAL AND MUNICIPAL EFFLUENTS,
North Carolina State Univ., Raleigh. Dept. of Soil Science.
B. L. Carlile, and J. A. Phillips.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-257 093, $5.00 in paper copy, $3.00 in microfiche. North Carolina WateResources Research Institute, Raleigh, UNC-WRRI Rpt. No. 118 July 1976. 63 p, 5 fig, 22 tab, 44 ref, 2 append. OWRT A-071-NC (2) 14-31-0001-5033.

Descriptors: *Waste water disposal, *Municipal wastes, *Industrial wastes, *Design criteria, Irrigation, Nutrients, Nitrogen, Salts, Heavy metals, Soil drainage, Vegetative cover, Hydraulics, Soil classification, Waste water treatment, Waste disposal, *North Carolina, Organic wastes.
Identifiers: *Land application, *Land disposal, Coastal Plain soil(NC).

The suitability of soils of North Carolina for application of industrial and municipal wastes was studied. In the Coastal Plain soil resource area, soil drainage is the most critical physical parameter in determining suitability of field sites for waste applications. Of the seven field sites investigated, five were located in the Coastal Plain soil resource area and two in the Piedmont soil resource area. Design loadings which can be utilized at these sites varied considerably, including hydraulic loadings of one inch per week on the Piedmont sites and up to four inches per week on the rapidly drained sands of the Coastal Plain. Organic loadings which could be successfully utilized on each site ranged from about 1100 lb/a/wk to about 4000 lb/a/wk total oxygen demanding material, again with the lower rates required on the Piedmont soils. Of the sites investigated, salt problems were responsible for more operational problems than any other design parameter. Wastewater containing up to 500 mg/l of sodium ions can be successfully applied on most field sites if either proper balances of Ca + Mg are maintained in the water or by application of soil amendments to the field. Total salt loads of up to 3000 mg/l can be applied to fescue pastures without restricting plant growth. If the above parameters as well as nutrient and heavy metal loadings are balanced to site capabilities and if sound management practices of the soil-crop, irrigation, and other operational functions followed, land application of wastewater can be a technically and economically sound system for treating waste loads at many industrial and municipal sites in North Carolina.

OVERLAND FLOW PRETREATMENT OF WASTEWATER,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
M. R. Overcash, D. M. Covil, J. W. Gilliam, P. W. Westerman, and F. J. Humenik.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-257 143. $6.75 in paper copy, $3.00 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Rpt. No. 117, July 1976. 140 p, 16 fig, 36 tab, 51 ref. OWRT B-067-NC (2) 14-31-0001-4113

Descriptors: *Overland flow, *Pre-treatment(Water), *Nutrient removal, *Waste water treatment, *Waste treatment, Municipal wastes, Industrial wastes, *Nitrogen, Nutrients, Recycling, Farm wastes, Poultry, Agricultural runoff, Path of pollutants, Nitrification, Denitrification, Nitrates, Southeast U.S.
Identifiers: Agricultural wastes, Poultry wastes, Nutrient loading, Hydraulic loading.

Overland flow (OLF) as a pretreatment process for wastewater was studied in a three part approach: (1) an assessment of established treatment mechanisms and literature data to rank the potential uses of the OLF process for municipal, industrial, and agricultural wastes according to advantageous usage in the Southeast; (2) experimental research into nitrogen transformations occurring in OLF for poultry manure; and (3) the scale-up application of research and project results to a farm animal production level. With regard to municipal wastes, OLF was estimated to be most advantageous when used to replace secondary treatment followed by direct stream discharge or by advanced treatment. Benefits were also derived when OLF was used as secondary treatment prior to terminal land application. The OLF study of nitrogen transformations for poultry manure indicated the largest N pathway was the unaccounted for losses which include nitrification-denitrification and ammonia volatilization (50-70 percent of influent N). Grass uptake was 5-20 percent, and conversion to nitrate in the effluent liquid was 5-10 percent of the influent N. The smallest pathways (1-3 percent) were the soil-water percolation beyond 2.4 m depth and rainfall runoff losses. Similar levels of total N losses were achieved for 1670 kgN/ha./yr and 2970 kgN/ha./yr; for hydraulic loadings of 4/cm/week and 7.6 cm/week; and for rest periods of 22 hours and 46 hours. Nitrogen losses increased from 50-65 percent after 15 m of flow to 70-80 percent after 30 m of flow distance. Increased rest periods and lower waste application rates favored larger nitrification potential. (Stewart-North Carolina State)

Descriptors: *Acid mine water, *Cation exchange, *Electrode, *Waste water treatment, *Water treatment, Chelation, Chemical analysis, Cost, Demineralization, Ion exchange, Mine acids, Mine water, Treatment, Water pollution, Water quality.
Identifiers: Cation exchange medium, Graphite, Electrogeneration, Metal-ion pollutants, Sulfonated graphite.

This study is directed toward the development of material and methods useful for removing metal-ion pollutants from water. Several modified graphites were prepared that had ion-exchange or chelating properties capable of removing Fe(+3), Ni(+2), Co(+2), Mg(+2), and Ca(+2) from water. The absorption capacities of these modified graphites are too low for economical use in water treatment. They are useful for analytical separations, however. Attempts at producing materials with higher absorption capacities were unsuccessful. Adjustment of pH and removal of some metal ions as the hydroxides by the electrogeneration of base appear to be a practical process for large-scale water treatment.

WATER PURIFICATION APPARATUS,
F. G. Mayer.
U.S. Patent No. 3,957,589, 4 p, 5 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1214, May 18, 1976.

Descriptors. *Patents, *Water purification, *Water treatment, *Distillation, *Water pollution treatment, Water quality control, *Condensation, Steam, Cooling, Equipment condensers, *Waste water treatment.

A water purifying apparatus has an inner chamber to be filled with contaminated water which is heated by a heating unit to a point where water vapor or steam is created. The steam is evacuated from the chamber at its upper portion and passes downward in contact with a condensing wall having cooling vanes on its exterior into a trough provided near the base of the apparatus. Water is drained off into a container located below the chamber. A cover surrounds the cooling vanes forming an annular air passage and is so constructed that open areas exist near the base of the cover. The cover has an aperture on top and a fan is placed below the aperture. Cooling air is carried from the open areas near the base of the apparatus upward over the vanes and to the aperture at the top where it is continuously evacuated. With this structure the vanes are continuously cooled without affecting the heating operation in the chamber itself. Pure water is obtained from the condensed steam in a rapid and efficient manner. (Sinha-OEIS)

WASTE-WATER PURIFICATION,
Sterling Drug Inc., New York. (Assignee).
P. V. Knopp, and W. B. Gitchel.
U.S. Patent No. 3,957,632, 6 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1227, May 18, 1976.

Descriptors: *Patents, *Waste water treatment, Water pollution treatment, *Sewage treatment, Organic wastes, Adsorption, *Activated carbon, Oxygen, Nitrification, *Denitrification, *Activated sludge, Anaerobic conditions.

The process of simultaneous removal of organic carbonaceous material and biological oxidation of the reduced nitrogenous forms in waste-waters followed by subsequent reduction of the oxidized nitrogen to elemental nitrogen is comprised of the following steps: waste-water containing ammoniacal nitrogen is fed into a vessel containing a developing active biomass having a sludge age of at least about three days; an aqueous suspension of powdered activated carbon is introduced simultaneously with the addition of a non-condensible oxygen containing gas; aerobic conditions are maintained for at least one hour to substantially oxidize ammoniacal nitrogen to nitrite or nitrate nitrogen; the powdered activated carbon, associated adsorbed organic material and biological solids are settled and separated and returned to the inlet end; the liquid phase is passed to an anaerobic zone containing denitrifying organisms to which further powdered activated carbon and organic carbon is added so that oxidized nitrogen forms are reduced to elemental nitrogen and solids accumulate; the mixture is passed to a quiescent zone where the powdered activated carbon and associated organic material are substantially removed from the wastewater; and the effluent is removed. (Sinha-OEIS)

SEWAGE TREATMENT METHOD AND APPARATUS,
ITT Industries, Inc., New York. (Assignee).
G. Gatti, and H. Fries.
U.S. Patent No. 3,957,633, 4 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1228, May 18, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Water pollution treatment, *Aeration, Pumps, Pumping plants, Conduits, Equipment, Flow.

A method and apparatus is provided for aerating sewage water in a tank such as a sewage water pump station. A pump is mounted in the tank with its inlet submerged in the sewage water. A conduit is connected to the outlet of the pump for providing flow communication between the pump and an outlet pipe of the tank. Sewage aeration is provided in the conduit. This aeration includes an air intake pipe which has an inlet outside of the tank allowing air to be drawn into the conduit. The conduit includes means for directing the flow of sewage water from the pump through the aeration means back into the tank. In addition, such means is shiftable to a position allowing flow of sewage water from the tank to the outlet pipe for transport to an additional pump station. As a consequence, a single pump is utilized for both aerating the sewage water and transporting it from one station to the next. (Sinha-OEIS)

THE SEPTIC TANK--A METHOD OF SEWAGE DISPOSAL FOR PRIVATE OR PUBLIC BUILDINGS,
Arizona State Dept. of Health Services, Phoenix. Engineering Bulletin No 12, June 1971. 22 p, plates, 3 tab.

Descriptors: *Arizona, *Septic tank, *Legislation, *Design standards, *Sewerage, Sewage disposal, Waste disposal, Sewage treatment, Wastes, Disposal, Environmental sanitation, Sanitary engineering, Specifications, Structural design, Administration, Regulation, Maintenance, Operation and maintenance, Sewage sludge, Leaching, Digestion, Treatment facilities.

This bulletin sets forth the applicable standards for septic tank construction in Arizona. The principles governing the operation of septic tanks are discussed to acquaint interested persons with the need and purposes behind the standards. Before any septic tank construction may begin, approval of the design and installation of the septic tank disposal system is necessary. Site conditions and percolation tests are important considerations influencing approval. Once the system is approved, certain specifications must be followed in the design and construction of the septic tanks. Two types of leaching systems which can be used are also discussed. Once the system is ready for service, the digestion process will begin automatically with the introduction of suitable bacteria. After operation begins, the accumulated sludge and scum in the system should be cleaned out regularly. (Hadoulias-Florida)

MINIMUM REQUIREMENTS FOR DESIGN, UBMISSION OF PLANS AND SPECIFICA-IONS OF SEWAGE WORKS.
rizona State Dept. of Health Services, Phoenix.
rizona State Department of Health Engineering ulletin No 11, September 1970. 43 p.

escriptors: Facilities, *Legislation, *Design stan-ards, *Arizona, *Sewage treatment, Sewage sposal, Waste disposal, Wastes, Sewerage, ewers, Disposal, Environmental sanitation, Sani-ry engineering, Sewage sludge, Pumping plants, udge, Primary treatment, Secondary treatment, ewage sludge treatment, Structural design, Con-ruction, Administration, Specifications, Regula-on, *Treatment facilities.

e Arizona State Board of Health has promul-ted rules and regulations governing the design, nstruction and operation of sewerage systems d waste treatment works. This bulletin is in-ded to serve as a guideline to those rules, and to orm those persons designing and submitting ns for sewerage and industrial waste collection atment and disposal systems. The bulletin sets th the minimum standards acceptable for plans d specifications submitted to the State Depart-nt of Health. The guidelines include a descrip-n of the types of factual data that must be in-ded in the plans submitted for approval. The ign structures which must be included in sewer tems and sewerage pumping stations are set th along with specifications for plant layouts, nt detail, plant facilities, and construction. Also forth are procedures relating to various treat-nt methods including primary, secondary, dge digestion and disposal, disinfection, odor trol and stabilization ponds. If the standards tained in this bulletin are followed, compliance n the pertinent rules and regulations will be as-ed. (Hadoulias-Florida)

Descriptors: *Actinomycetes, *Sewage treatment, *Activated sludge, *Aeration, *Waste water treatment, *Pollution abatement, Water pollution, Microbiology, Foaming, Water quality control.
Identifiers: Nocardia amarae.

In some sewage-treatment plants of the activated sludge type, a thick foam may be formed at the surface of the secondary aeration and settling tanks. Such foams have often been found to be rich in actinomycetes. This report covers the work done on this problem between April 1971 and May 1974. Over 250 strains of actinomycetes have been isolated from foams or activated sludge from 19 different sewage-treatment plants located in 8 states. The actinomycete most commonly associated with foams is a previously undescribed Nocardia which has been given the name N. amarae. It has been demonstrated experimentally in the laboratory that N. amarae may cause the kind of foam observed in the plants. Factors affecting the growth of N. amarae have been studied and a method was proposed for control of the foam by addition of digester supernatant to the activated sludge. (Sinha-OEIS)

PRELIMINARY RESULTS WITH A PILOT PLANT WASTE RECYCLING MARINE-AQUACULTURE SYSTEM,
Woods Hole Oceanographic Institution, Mass.
J. H. Ryther.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 182, $4.50 in paper copy, $3.00 in microfiche. Technical Report No. WHOI-75-41, September 1975. 31 p, 11 fig, 5 tab, 6 ref. 04-4-158-5; 04-5-158.

Descriptors: *Aquiculture, *Recycling, *Pilot plants, *Shellfish farming, *Fish farming, *Sewage effluent, *Pollution abatement, Algae, Waste water disposal, Mollusks, Fish, Water reuse.
Identifiers: Seaweeds.

A combined waste recycling-marine aquaculture system capable of complete nitrogen removal from treated domestic wastewater was developed and tested on a pilot-plant scale over a one-year period. Effluent from secondary sewage treatment, mixed with seawater was used to grow unicellular marine algae in large, continuos-flow, outdoor mass cultures. Harvest from the algae cultures was fed to oysters and other filter-feeding bivalve molluscs and to secondary crops of flounder or lobsters. Dissolved wastes produced by the animals were assimilated by cultures of commercially-valuable seaweeds. Successful cultures of unicellular algae, mostly diatoms, and seaweeds were sustained over long periods of time (months) with only minor problems. Algal yields and nitrogen removal capacity varied seasonally by 3-4 fold and were controlled by solar radiation but not by temperature. Assuming that problems with shellfish culture can be resolved, a combined unicellular algae-shellfish-seaweed system is capable of complete nitrogen removal from wastewater effluent within an area of 48 acres and with an estimated annual production of 183 tons of oyster meat, 3,350 tons wet weight of seaweeds and undetermined quantities of flounder and/or lobsters per MGD effluent treated (wastes per 10,000 capita). A seaweed system alone is capable of nitrogen removal in an area of 60 acres with annual production of 16,300 tons wet weight of seaweeds. (Sinha-OEIS)

RECHARGE OF RECLAIMED WASTE WATER: RESEARCH NEEDS,
Texas A and M Univ., College Station. Dept. of Civil Engineering.
In: Proceedings, Tenth Biennial Conference on Ground Water, September 11-12, 1975. Ventura, California, p 76-87. 2 tab, 35 ref. OWRT B-146-TEX(3).

Descriptors: *Reclaimed water, *Recharge, *Water reuse, Water chemistry, *Trace elements, Arsenic, Cadmium, Chromium, Copper, Iron, Mercury, Manganese, Nickle, Lead, Selenium, Strontium, Zinc, *Activated sludge, *Nitrification, Texas, California, Research priorities, *Waste water treatment, Metals.
Identifiers: Carcinogenic compounds, Tumorigenic agents, Nitrifying bacteria, Heterotrophic bacteria, Dallas(Tex), Trace metals.

Certain compounds and metals have been observed to demonstrate carcinogenic properties. Recognition that factors in the environment could be responsible for the initiation of tumors could incriminate both food and water as major sources of environmental tumorigenic substances. Trace metals contained in reclaimed waste water are among the substances under study. A study was done at Dallas, Texas examining metal removal by various advanced waste treatment (AWT) processes. The basic biological process used was nitrifying an activated sludge system. Metal removal is enhanced by a nitrifying system and fewer bacterial viruses are also present. The nitrified operation has a much more immediate role in the recharge situation. The amount of dilution waters presently required could be substantially reduced by conversion of waste treatment plants to highly nitrified operations. (Heiss-NWWA)

RECYCLE--REUSE, INFALL--OUTFALL, DECISIONS CONFRONT SCIENCE, PUBLIC,
Central and Southern Florida Flood Control District, West Palm Beach.
J. Browning.
In Depth Report, Vol 1, No 6, p 1-12, June 1972. 12 p, 1 fig, 3 tab.

Descriptors: *Water districts, *Recycling, *Waste storage, *Waste treatment, *Aquifers, Activated sludge, Aeration, Tertiary treatment, Geologic formations, Wastewater treatment, Freshwater, Water pollution treatment, Groundwater, Groundwater resources, *Water reuse.

Set forth in this guide book is background material designed to help the atechnical person understand the difference between recycling and reuse and the problem of continuous ocean waste discharge. Also described is the use of models for predicting seawater encroachment on freshwater aquifers. New methods of wastewater treatment include injection into deep, unused geologic formations, extended aeration, and activated sludge processes. Secondary processes may not kill viruses in wastewater, and, therefore, tertiary processes may be required. Tables indicate constituent removals by various wastewater reclamation projects as well as costs for each. Decision must be made as to the future course of wastewater treatment, since society may not be willing to bear the cost of 100% pollution free water. (Frank-Florida)

POLLUTION CONTROL IN MEAT, POULTRY AND SEAFOOD PROCESSING,
H. R. Jones.
Noyes Data Corporation: Park Ridge, New Jersey; London, England. 1974. 263 p, Pr. $36.00.

Descriptors: *Food processing industry, *Poultry, *Pollution abatement, Water pollution control, *Waste water treatment, *Industrial wastes, Biodegradation, Patents, Air pollution, Odor, Nitrogen.
Identifiers: *Seafood processing, *Meat processing.

This book deals primarily with wastewater treatment and pollution reduction for the meat processing, the poultry processing and the seafood processing industries. Animal slaughtering and meat processing produce a highly loaded, but biologically degradable, wastewater containing dissolved suspended and dispersed fibrous animal matter with high nitrogen content. It also creates serious air pollution and odor removal problems. Poultry and seafood wastes have similar problems. Condensed data from government sources are coordinated and important pollution removal processes are interpreted and explained by examples from recent USA patents. The table of contents serves as a subject index and bibliographies are included with each section. A special section is devoted to future trends and recommendations. Other indexes by company, inventor and patent number help to provide access to the information.--Copyright 1974, Biological Abstracts, Inc.

DESIGNING POST-CHLORINATION BY CHEMICAL REACTOR APPROACH,
Southern Illinois Univ., Edwardsville. Dept. of Urban and Environmental Engineering.
P. Kokoropoulos.
J Water Pollut Control Fed. 45(10); p 2155-2165, 2241, 1973.

Descriptors: *Chlorination, *Waste water treatment, *Water treatment, *Treatment facilities, Design, Bacteria, Disinfection.
Identifiers: *Post-chlorination, *Chemical reactors.

Chemical reaction engineering concepts can be applied in the analysis and design of post-chlorination facilities. The post-chlorination process can be considered as a multicomponent, open system, where several parallel, competing reactions occur simultaneously but at different rates. The proposed design is a multiple-reactor system of backmix stages in series. The number of stages and the holding times are chosen so that the system approaches plug-flow conditions. Calculations show that multiple backmix reactor systems exhibit high conversion efficiencies (99.9% bacterial kill), at reasonable holding times and are readily amenable to expansion by additional stages. Typical examples of application of the design in post-chlorination are given.--Copyright 1974, Biological Abstracts, Inc.

Culp, Wesner, Culp-Clean Water Consultants, El Dorado Hills, Calif.
W. F. Ettlich.
In: 3rd National Conference on Complete WateReuse, June 27-30, 1976, Cincinnati, Ohio, p 140-146. 11 fig, 3 tab.

Descriptors: *Cost comparisons, *Cost analysis, *Sludge, *Transportation, Pipelines, Railroads, Barges, Costs, Economics, Evaluation, Waste disposal.
Identifiers: Trucks.

A cost analysis of various sludge transport methods is presented. The total annual cost for the transport of dewatered sludge by railroad is less than that associated with truck transport, although railroad facilities are more capital intensive than truck facilities. Truck is the least expensive mode for liquid sludge transport over one-way distances of 20 miles or less and for sludge volumes less than 10-15 million gallons/year. Pipeline is the least expensive transport mode when the annual sludge volume is greater than approximately 30-70 million gallons, depending on distance. Pipeline is not economically attractive for annual sludge volumes of 10 million gallons or less because of the high capital investment. Rail and barge are comparable over the 7-700 million gallon volume range for long haul distances. Barge is more economical than rail for short to medium distances and for annual sludge volumes greater than 30 million gallons. (See also W76-11257) (Kreager-FIRL)

Descriptors: *Deep wells, *Hydraulics, *Injection wells, *Wells, Injection, Brines, Wastewater disposal, Waste water treatment, Water policy.
Identifiers: Environmental impact.

As of mid-1973, at least 278 industrial wastewater injection wells had been constructed in 24 states. Statistics concerning these wells are presented and their environmental impact appraised. A few states have specific laws and regulations concerning such wells, but most states use existing general statutes. Straight-line projections would indicate that about 614 wells will have been constructed by 1985 and 1,034 by 2000. Brine wastes are the most likely to continue to be injected in the future. It is estimated that strict interpretation of present Federal law would cause the production of more than 200 mgd of brine that would require disposal by injection or other means as compared with 90 mgd that was being injected in 1973. The policies and procedures adopted by ORSANCO are suggested as a model for others to consider. (Bell-Cornell)

U.S. Patent No. 3,957,617, 4 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1223, May 18, 1976.

Descriptors: *Patents, *Water treatment, *Demineralization, *Hardness(Water), Water softening, Scaling, Electric currents, Electric fields.

A fluid treatment apparatus is comprised of a fitting having inlet and outlet passages for coupling in a flow line. The fitting defines an electrically conductive bell-shape housing having inlet and outlet chambers and a perforated electrically conductive screen insulatively supported between the chambers. An electric potential is applied between the electrically conductive bell-shaped housing and the electrically conductive screen. The electric field established between the screen and fitting affects the water flowing through the fitting to eliminate the mineral and other deposits already accumulated in the downstream water system and prevents further accumulation. SPHINCTER CONE ASSEMBLY FOR PURIFYING WATER,
B. B. Barefoot.
U. S. Patent No. 3,957,655, 3 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1236, May 18, 1976.

Descriptors: *Patents, *Water treatment, *Water purification, *Water pollution treatment, Water pollution control, Water quality control, Suspended solids, Turbulence, Mixing, Equipment, *Waste water treatment.
Identifiers: *Sphincter cones, Particulates.

The sphincter cone is a water treatment and clarification vessel which contains no moving parts. The return or recirculated water is introduced into the cone through the surge tank located at the top center of the cone and having an open bottom. The surge tank nullifies turbulence of the incoming water. From here the water is driven out of the bottom of the surge tank and rises upward and radially outward from the center of the cone towards the outside circumferential sump formed between the inner circular wall and the outer wall. The bottom 6 feet of the circumferential sump is pitched or inclined downward toward the outlet pipe. This construction combined with the settling velocities of the descending suspended particulate directed towards the outlet serves to very adequately remove the solids from the water. The water is then drained in its clarified state away from the cone through the outlet pipe and is then ready for recirculation or return to the sewage system or streams. Should the water require more than simple clarification, then the sphincter cone can serve as a water treatment vessel whereby the chemical additives are introduced upstream of the surge tank and through the turbulence in the surge tank, are thoroughly mixed and dispersed throughout the entire volume of water, thus resulting in uniform water treatment. EDUCATIONAL AND INFORMATIONAL NEEDS FOR ACHIEVING PUBLIC ACCEPTANCE,
Purdue Univ., Lafayette, Ind. Cooperation Extension Service.
J. O. Dunbar.
In: Land Application of Wastewater, November 20-21, 1974, Newark, Delaware, p 35-38. 3 ref.

Descriptors: *Waste water disposal, *Sludge disposal, *Recycling, *Information exchange, *Education, *Attitudes, *Waste treatment, Phychological aspects, Political aspects, Social aspects.

An educational and informational program is proposed for gaining public acceptance of the idea of recycling urban effluents and sludges to the land. The program is outlined in terms of necessary behavioral changes required, educational methods for achieving attitude changes, and means for communicating information on the subject. The program is divided into four parts corresponding to the following types of audiences: the general public, decision makers and others concerned with environment and waste treatment, people with vested interests that will be significantly affected by waste recycling, and professionals from government agencies who work closely with people affected by the decision. Department of the Environment, Ottawa (Ontario). Liaison and Coordination Directorate.
R. M. Robinson.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 161-178.

Descriptors: *Legislation, *Great Lakes, *Water pollution control, *Canada, *United States, Municipal wastes, Legal aspects, Waste treatment, Nutrients, Surface waters, International Joint Commission, Water law, Monitoring, Institutions.
Identifiers: Great Lakes Water Quality Agreement.

The development and implementation of the Great Lakes Water Quality Agreement of 1972 is reviewed. The agreement which sets out objectives and commitments of the United States and Canada regarding the protection of the water quality of the Great Lakes also identifies programs needed to achieve these objectives, establishes institutional mechanisms required to make the agreement as self-policing as possible, and creates a constant review process. An International Joint Commission is responsible for monitoring the progress on both sides and for reporting the results to the governments as well as the public. Canadian programs for installing municipal waste treatment facilities and controlling nutrient inputs are currently near to meeting the goals established in 1972. Significant progress is also being made by the United States, although adequate municipal waste treatment facilities presently serve only 60% of the sewered population on the United States side. This figure is expected to rise to 95% by 1978. (See also W76-11249) (Kreager-FIRL)

R. Norton.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association,April 20-23, 1975, Toronto, Ontario, p 326-331.

Descriptors: *Safety, *Treatment facilities, *Water treatment, *Waste water treatment, *Protection, Chemicals, Personnel, Programs, Management, Equipment.

The development of safety programs for water and waste water treatment plants is discussed, with particular emphasis on employer-employee responsibilities. The employer's responsibility centers around gaining the interest and cooperation of employees, with emphasis on preventive safety measures during daily operational activities. Employees in turn can assist management in the development of a preventive safety program and can alert the employer when unsafe conditions exist. Hazardous areas and activities encountered in water and waste water treatment operations include: enclosed spaces such as sewer manholes and watermain valve pits, digester control buildings where methane leaks are possible, chlorination rooms, and activities involving the handling of water treatment chemicals and the dismantling of water treatment equipment. The use of personal protective equipment in hazardous areas is also discussed. (See also W76-11249) (Kreager-FIRL)

OPERATOR TRAINING AND CERTIFICATION IN CANADA,
Environmental Protection Service, Ottawa (Ontario).
A. B. Redekopp.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 348-362. 3 tab, 7 ref.

Descriptors: *Training, *Treatment facilities, *Personnel, *Education, *Canada, Water treatment, Waste water treatment, Programs, Organizations, Operations.
Identifiers: Certification.

The status of training and certification programs for waste water and water treatment plant operators in Canada is reviewed. Voluntary certification programs have been established by four provinces to date: British Columbia, Alberta, Saskatchewan, and Manitoba. The Federation of Associations of the Canadian Environment is currently developing nationally acceptable guidelines for operator certification and is considering approaches to assist the provinces in operator training. Current training efforts in Canada cover, for the most part, the general knowledge area of water and waste water treatment operations through seminars or short courses provided by the provincial regulatory agencies and/or local operator associations. The Federal Department of the Environment, however, is currently assisting the three Maritime Provinces in the development of a comprehensive training program for waste water treatment operators which is based on a performance oriented approach to learning. TRAINING AND CERTIFICATION,
Ontario Ministry of the Environment, Toronto. Training, Certification and Safety Section.
R. R. Doddridge.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975, Toronto, Ontario, p 363-374. 1 fig, 4 tab, 2 ref.

Descriptors: *Training, *Treatment facilities, *Personnel, *Education, *Canada, Water treatment, Waste water treatment, Programs, Organizations, Operations.
Identifiers: Certification, Ontario.

Progress in the training and certification of water and waste water treatment plant operators in Ontario is reviewed. Training programs for water and waste water facility operators have been provided in Ontario for a number of years, with the Ontario Water Resources Commission offering annual courses at the basic, intermediate, and advanced levels. The Ontario Ministry of the Environment has proposed a 4-year program leading to mandatory certification. The development of the program was initiated in 1973 and 1974. The initial program consisted of the following elements: a basic water treatment course, a basic sewage treatment course, a basic gas chlorination workshop, and an activated sludge workshop. In 1974 and 1975 the subject areas were expanded to include a surface water treatment workshop and a maintenance gas fitter certificate course. Further expansion is scheduled for 1975 and 1976 and is expected to include a primary treatment and digestion workshop, a preventive maintenance workshop, a pumping operation workshop and safety and first aid training. THE ECONOMIC IMPACT OF CONTROLLING NONPOINT POLLUTION IN HARDWOOD FORESTLAND,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Economics.
W. L. Miller, and H. W. Everett.
American Journal of Agricultural Economics, V 7, No. 4, p. 576-583, 1975. 1 fig., 3 tab., 24 r
OWRT B-042-IND (7) 14-31-0001-3586

Descriptors: *Water quality control, *Econon impact, *Forest management, *Sediment contr Lumbering, *Indiana, Measurement, Incon Costs, Model studies.
Identifiers: *Nonpoint pollution control, Linc Hills(Ind).

Two models were developed based on the Linc Hills area in Indiana to compare alternative m sures of the economic impact of forest mana ment practices, harvesting methods, and rates harvest which could be introduced to reduce sediment loss from forest land. Controlling n point pollution results in substantial economic pact both on the firms directly affected and the gion. As the economic activity is constrained placing limits on soil loss at 106,280 tons per ye the regional economic impact is reduced to million annually. The annual reduction in regio income that occurs as soil loss declines fr 156,280 to 106,280 tons per year results in a 76 c reduction in income to the region for each reduction in soil loss. As the soil loss leve further reduced to 56,280 tons per year, regio income is reduced about $1.4 million more nually or about an additional $28 annually for e ton reduction in soil loss. The opportunity cos income foregone is the appropriate measure of cost to society for introducing various nonp pollution control measures. The cost of control nonpoint pollution is being greatly underes mated; thus it is suggested that the regional imp may be a more appropriate measure than the di impact. (Auen-Wisconsin).

Report NCWQ 75/48, November 1975, 617 p. WQ5ACO11.

Descriptors: *Pollution abatement, *Industrial wastes, Industries, Forecasting, *Federal Water Pollution Control Act, *Economic impact, *Industrial plants, *Water pollution control, *Operating costs, *Estimated costs, Foods, *Food processing industry.
Identifiers: *Meat products industry, Federal Water Pollution Control Act Amendments of 1972.

Economic impact on the meat products industry of achieving the 1977 best practicable technology (BPT) and 1983 best achievable technology (BAT) effluent limitation requirements of the Federal Water Pollution Control Act Amendments of 1972 (P.L. 92-500) were assessed. The analysis considers these impacts in four categories of the industry -- processing, rendering, packing and poultry. Estimated price increases as a result of the Act are given along with total investment and anticipated operating costs necessary to meet the Act's requirements. The analysis projects the numbers and kinds of plants most likely to close as a result of the BPT and BAT requirements, and estimates resulting employment losses for each category. (NCWQ)

Identifiers: Federal Water Pollution Control Act of 1972, *Technology assessment.

Technologies capable of achieving compliance with effluent limitations required for dischargers to comply with Public Law 92-500 were investigated. Applicable technologies were determined for publicly owned treatment works, industry and irrigated agriculture point sources. Costs and manpower and energy requirements for each technology were also defined. Technologies capable of reducing pollutants from non-point sources were examined in summary fashion. A technical assessment of Public Law 92-500 is presented along with an explanation of methodology, data sources and Commission staff calculations. Also included are lists of Contractors and Consultants and summaries of about 20 Technology Contractor Reports. (NCWQ)

WATER POLLUTION CONTROL ACT OF 19 REGIONAL IMPACTS, YELLOWSTO RIVER BASIN.
Stevens, Thompson and Runyan, Inc. Seatt Wash.
Available from the National Technical Inform tion Service, Springfield, Va. 22161, as PB-2 072, $7.25 in paper copy, $3.00 in microfiche. N tional Commission on Water Quality, Washingt D.C., Report NCWQ 75/50, March 1976. 205 p, fig, 62 tab, 224 ref. WQ5AC051.

Descriptors: *River basins, *Regional analy Wyoming, Montana, Regions, *Federal Water P lution Control Act, Water pollution cont Capital costs, Pollution abatement, Water qual Treatment facilities, Water law, Evaluati *Estimated costs, Forecasting, Estimating, Inc tries, Social change, *Social impact, Water util tion.
Identifiers: *Yellowstone River Basin(W Mont), Federal Water Pollution Control Amendments of 1972.

The environmental, economic, social and ins tional impacts of the Federal Water Pollution C trol Act Amendments (PL 92-500) in the lowstone region will generally be small and occur near the various dischargers. The 1983 available treatment (BAT) and 1985 eliminatio discharge (EOD) goals of the Act will not pro a measurable change in the long-term water qu and biological conditions resulting from the best practicable technology (BPT) requiremen the Act. Total capital costs (in 1973 dollars) w an estimated $114 million for BPT with an tional $140 million for BAT. Industries most h ly impacted will be uranium mining, coal m and sugar beet processing. Communities 2,500 people or less, which are required to struct new or upgraded treatment facilities, experience severe social impacts. Regarding use, strict implementation of the law has a p tial to create several economic, legal and

ality problems with apparently insignificant
ter quality benefits to offset these problems.

omprehensive water quality analysis and en-
nmental impact assessment at the Lower Mis-
i River was undertaken as part of a national
ssment of anticipated environmental impacts
heoretically achieving or not achieving the
irements of the Federal Water Pollution Con-
Act Amendments of 1972 (P.L. 92-500). The
ysis (1) characterized historical and existing
r quality and environmental conditions, (2)
ected resultant water quality, assuming
ific levels of wastewater treatment to point
ce effluents entering the study site, and (3) an-
ated biological, ecological and environmental
ts, impacts and benefits to result from pro-
d changes in water quality. This site assess-
is one of 41 similar studies conducted for the
ronmental Sciences sector of the National
mission on Water Quality. (NCWQ)

WATER POLLUTION CONTROL ACT OF 1972, ECONOMIC IMPACTS, DAIRY PRODUCTS.
Development Planning and Research Associates, Inc., Manhattan, Kans.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 217, $8.00 in paper copy, $3.00 in microfiche. National Commission on Water Quality, Washington, D.C., Report NCWQ 75/46, November 1975, 215 p. WQ5ACO11.

Descriptors: *Pollution abatement, *Economic impact, *Cost analysis, *Federal Water Pollution Control Act, Industries, Treatment facilities, Forecasting, *Estimated costs, Income, Prices, Engineering costs, *Industrial plants, *Water pollution control, *Dairy industry, *Food processing industry.
Identifiers: Federal Water Pollution Control Act Amendments of 1972.

The economic impacts on the dairy industry of meeting the requirements of the Federal Water Pollution Control Act Amendments of 1972 are examined. The impostion of the 1977 best practicable technology (BPT) and 1983 best available technology (BAT) controls will reduce the net income of larger plants by 30% and a reduction of 50% will be experienced by medium size plants. Of the 4,590 existing establishments, an estimated 164 plants will close as a result of 1977 controls, and the combined costs of BPT and BAT will result in approximately 96 fewer plants in 1983 than in baseline. Most heavily impacted will be single plant firms. Price increases will be about 1% over baseline for BPT with an increase of 0.4% over baseline for BAT. Those dairy product plants which do not discharge into municipal systems can meet BPT by biological treatment systems. Housekeeping improvements coupled with a reduction in water use are recommended to ease the wasteload. BAT requirements can be met by adding tertiary filtration or land disposal to the BPT controls. (NCWQ)
W76-11801

WATER POLLUTION CONTROL ACT OF 1972, ECONOMIC IMPACTS, FOREIGN TRADE,
Public Research Inst., Arlington, Va.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-249 949, $10.50 in paper copy, $3.00 in microfiche. National Commission on Water Quality, Washington, D.C., Report NCWQ 75/34, February 1976. 355 p, 6 fig, 65 tab. WQ5AC009.

Descriptors: Pollution abatement, *Industries, *Economic impact, Iron, Steel, Aluminum, Copper, *Federal Water Pollution Control Act, Forecasting, *Econometrics, Estimating, *Import, *Foreign trade, Water pollution control, *Pulp and paper industry, *Food processing industry, *Mineral industry, Textiles.
Identifiers: Federal Water Pollution Control Act Amendments of 1972.

An analysis is presented of the impacts of the Federal Water Pollution Control Act Amendments of 1972 on seven industries -- iron and steel, aluminum, copper, textiles, pulp and paper, leather tanning and red meat. Econometric models with foreign trade sectors were developed and estimated for each of the industries. Import penetration in the iron and steel industry will increase by an estimated 6% by 1985. Pulp production is estimated to decrease by as much as 1.5%, newsprint by as much as 3% and paperboard by as much as 6%. In most industries with high pollution abatement costs, the volume of trade is small compared to domestic production. Even major percentage changes in the volume of trade do not significantly affect the domestic industry. (NCWQ)
W76-11802

WATER POLLUTION CONTROL ACT OF 1972, ECONOMIC IMPACTS, FRUITS AND VEGETABLES.
Development Planning and Research Associates, Inc., Manhattan, Kans.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 216, $10.75 in paper copy, $3.00 in microfiche. National Commission on Water Quality, Washington, D.C., Report NCWQ 75/45, November 1975, 357 p. WQ5AC011.

Descriptors: *Water pollution control, *Economic impact, *Cost analysis, *Federal Water Pollution Control Act, Forecasting, *Treatment facilities, *Capital costs, Engineering costs, Prices, *Estimated costs, *Pollution abatement, *Industrial plants, *Canneries, *Food processing industry.
Identifiers: Federal Water Pollution Control Act Amendments of 1972.

The economic impacts on the fruits and vegetables processing industry of achieving the 1977 best practicable technology (BPT) and 1983 best available technology (BAT) requirements of the Federal Water Pollution Control Act Amendments of 1972 are assessed. The greatest price increases will be required by small and medium size plants in the corn, tomato and sauerkraut sectors. Increased prices will be an estimated 0.26% over baseline for BPT and will increase by an estimated .47% with the addition of pretreatment costs. Under BAT control standards, this figure becomes 0.62% by 1983. Total capital costs (in 1973 dollars) for BPT will be an estimated $128 million and $201.9 million for BPT and BAT respectively. Plant closures due to BPT are projected at 107 and an estimated 128 plants will close as a result of the combined costs of BPT and BAT. Most severely impacted will be the citrus plants in Florida, and potato dehydrating plants in Idaho, Oregon and Washington. (NCWQ)
W76-11803

WATER POLLUTION CONTROL ACT OF 1972, TECHNOLOGIES AND ECONOMIC IMPACTS, THE FEEDLOT INDUSTRY,
Development Planning and Research Associates, Inc., Manhattan, Kans.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 214, $10.75 in paper copy, $3.00 in microfiche. National Commission on Water Quality, Washington, D.C., Report NCWQ 75/47, November 1975. 409 p, 2 fig, 82 tab, 6 append. WQ5AC011.

Descriptors: *Pollution abatement, *Economic impact, *Feed lots, *Cost analysis, *Federal Water Pollution Control Act, Forecasting, Farm wastes, Technology, *Estimated costs, Engineering costs, Dairy industry, Hogs, *Water pollution control, Poultry.
Identifiers: *Feed lot industry, Beef, Federal Water Pollution Control Act Amendments of 1972.

The necessary technologies and associated economic impacts on the feedlot industry to meet the requirements of the Federal Water Pollution Control Act Amendments of 1972 are examined. Seventeen technologies and related costs for the beef, turkey, dairy and hog categories of the industry are assessed. If the law applies only to those feedlots which discharge directly into streams, compliance will require a total investment of between $346-446 million for best practicable tecnology (BPT), with an additional $107-118 million for BAT best available technology. Annual costs will be an estimated $66-82 million and $15 million for BPT and BAT respectively. Estimated total costs will triple if the law applies to all feedlots. The hog sector will require the most expenditures for effluent control, while the heaviest price and quantity impacts, though generally less than 1%, will fall in the dairy and turkey categories. Small feedlots will be the most heavily impacted and (among direct dischargers) an estimated 37,000 to 77,000 feedlot plants will close by

1977, with an additional 2,800-5,000 closing by 1983. About 80% of the closures will occur in the dairy and hog categories. (NCWQ)
W76-11804

WATER POLLUTION CONTROL ACT OF 1972, DEMOGRAPHIC AND QUANTITATIVE ANALYSIS,
Human Resources Planning Inst., Seattle, Wash.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 321, $5.50 in paper copy, $3.00 in microfiche. National Commission on Water Quality, Washington, D.C., Report NCWQ 75/44, December 1975. 112 p, 11 fig, 22 tab, 29 ref. WQ5AC086.

Descriptors: *Pollution abatement, *Social impact, Human population, Forecasting, *Federal Water Pollution Control Act, Water pollution control, Industrial plants, *Employment, Northeast U.S., Central U.S., *Unemployment, *Employment opportunities, Recreation, *Social change.
Identifiers: Federal Water Pollution Control Act Amendments of 1972.

An assessment is presented of the social impacts resulting from the primary and secondary impacts (as measured by changes in employment) of the Federal Water Pollution Control Act of 1972. Job creation, as a result of the Act, will accrue primarily to younger, white males in the middle income category. Females, older workers, and low income workers will be among those to experience the heaviest job losses. Plant closures (which will most heavily affect low income groups) will be concentrated in the Northeast and Northcentral regions of the U.S. If the existing lack of participation in water based recreation is a function of polluted water bodies, then recreation benefits will accrue most heavily to low income, non-white urban males. If, however, this low participation is a reflection of consumer preference rather than lack of clean water, greatest benefits will be concentrated among upper income, non-urban white males. (NCWQ)
W76-11805

PUBLIC LAW 92-500-- WATER QUALITY ANALYSIS AND ENVIRONMENTAL IMPACT ASSESSMENT, TECHNICAL REPORT (VOLUME I),
National Commission on Water Quality, Washington, D. C. Environmental Sciences Sector.
H. L. Allen, L. E. Johnson, R. E. Keen, E. R. Meyer, and J. L. Peterson.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-252 167-01-02 SET, $28.25 in paper copy, $3.00 in microfiche. Report NCWQ-75-100-1, April, 1976. 527 p.

Descriptors: Regions, *Federal Water Pollution Control Act, Sites, *Methodology, Water quality standards, Ecology, Projections, Benefits, Environmental effects, Limnology, *Water pollution control, *Regional analysis, *Pollution abatement, *Forecasting, *Water quality, Waste water treatment.
Identifiers: *Environmental impact, Federal Water Pollution Control Act Amendments of 1972.

The Environmental Sciences sector of the National Commission on Water Quality was charged with conducting a national water quality and environmental impact assessment as part of a larger analysis of the effects of achieving or not achieving the requirements and goals of the Federal Water Pollution Control Act Amendments of 1972 (P. L. 92-500). The overall study methodology, including inherent assumptions and limitations, is outlined. A major part of the national assessment focused on 41 site-specific studies in which historical and existing water quality and environmental conditions are assessed, followed by projections of change, impacts and benefits to result from abatement of point source effluent loadings. Results and findings from these studies are collated, reviewed and summarized, both regionally and nationally, and are presented in this volume. Volume II contains other special water quality and environmental assessment topics. (See also W76-11807) (NCWQ)
W76-11806

PUBLIC LAW 92-500--WATER QUALITY ANALYSIS AND ENVIRONMENTAL IMPACT ASSESSMENT, TECHNICAL REPORT, VOLUME II,
National Commission on Water Quality, Washington, D. C. Environmental Sciences Sector.
J. L. Allen, L. E. Johnson, R. E. Keen, E. R. Meyer, and J. L. Peterson.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-252 167-01-02 SET, $28.25 in paper copy, $3.00 in microfiche. Report NCWQ 75/100-2, April 1976, 570 p.

Descriptors: Regions, *Federal Water Pollution Control Act, Sites, *Methodology, Water quality standards, Ecology, Projections, Benefits, Environmental effects, Limnology, *Water pollution control, *Pollution abatement, *Regional analysis, *Forecasting, *Water quality, Waste water treatment.
Identifiers: *Environmental impact, Federal Water Pollution Control Act Amendments of 1972.

Special environmental assessment topics are presented, including (1) analysis of environmental effects of disposal of municipal and industrial wastewater-treatment residuals; (2) environmental effects of the disposal of municipal effluents into near shore marine waters; (3) effects of pollutants on bird species,; (4) evaluation of water quality models for site-specific and regional areas; (5) an overview of national waste loads and urban-suburban stream quality response; (6) a summary of national residuals production; (7) patterns in nine selected standing water bodies; (8) a summary of biological data used in site-specific studies; (9) the state of the art of projecting ecological and environmental change; (10) a review of existing water quality and environmental data systems, and (11) recommendations for advancing the state of the art of projecting water quality and environmental change. Appendix information includes work statements used in the studies, a listing of criteria applicable to possible expemptions under section 316 (thermal) of the Act and a list of staff, consultants etc. contributing to this report. (See also W76-11806) (NCWQ)
W76-11807

SHIP BALLAST, OIL AND WATER SEPARATION SYSTEM,
J. Di Perna.
U.S. Patent No. 3,957,009, 3 p, 5 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1031, May 18, 1976.

Descriptors: *Patents, *Oil pollution, *Oily water, *Water pollution control, *Water pollution treatment, Water quality control, *Separation techniques, Floating.
Identifiers: Ballast water.

The oil and ship ballast water separation system includes a main pipe extending longitudinally through the amid-ship tanks and which is connected by cross-tees to a series of branch pipes extending sideways and leading into the wing tanks. Each one of the tanks are connected to an upward extending flexible accordion pipe or duct which at its upper end is connected to a floating oil collection unit which includes a buoyant collar around a downward converging funnel that is open on top. The buoyancy of the collar is such that the floation of the unit is with the upper edge of the funnel being at water level surface, so that only oil above the water level flows down into the funnel. The main pipe extends at one end into the collection tank where it is fitted with an upward turned elbow so that the oil from all the tanks is thus collected in the collection tank. In operative use, it is now evident that prior to returning ballast water back into the sea, the residue oil is thus removed from the tanks on a day when the ship is not excessively rolling or pitching so that the oil is steady on top. After the oil is removed, the ballast water is returned to the sea prior to entry into port without contaminating the sea. (Sinha - OEIS)
W76-11827

DEVICE FOR SEPARATING LIQUIDS OF SPECIFICALLY LOWER DENSITY THAN WATER, AND PARTICULARLY OIL, FROM WATER,
Fabrique Euro Pollution Control Systems, Inc (Luxemburg). (Assignee).
P. Jakubek, and K. Biswanger.
U.S. Patent No. 3,957,641, 4 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1231, May 18, 1976.

Descriptors: *Patents, *Oil pollution, *Oily water, Water pollution sources, *Water quality control, *Water pollution treatment, *Separation techniques, Density stratification, Pumps, Equipment.
Identifiers: Bilge water.

A device for separating liquids of lower density than water, in particular oil, from water, comprises a pump and a separator receiving the liquid from the pump. The separator has a settling chamber and a filter pack arranged behind the latter. A line between the pump and the settling chamber feeds the liquids to the settling chamber and includes a vent valve. An overflow opening device is provided between the settling chamber and the filter pack. A shutoff member is provided for closing the overflow opening in response to the thickness of the layer of liquid of lower density collected in the settling chamber. The device is intended to make an effective pumping out of bilge possible and to reliably prevent water which has been contaminated with oil or the like from being pumped overboard. Also the device should be capable of automatic operation without requiring complicated electric controls. (Sinha - OEIS)
W76-11836

INSTALLATION FOR REMOVING POLLUTANTS FROM WATERWAYS,
F. M. Wickert.
U.S. Patent No. 3,957,646, 9 p, 13 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1233, May 18, 1976.

Descriptors: *Patents, *Water pollution control, Water pollution sources, *Oil pollution, Oil spills, *Oily water, Water pollution treatment, Water quality control, *Separation techniques, Skimming, River flow, Streamflow, Equipment.

A floating installation for the recovery of a liquid pollutant such as petroleum or the like, from navigable waterways, includes a main vessel adapted for floating movement in the water, a receiving tank connected to the main vessel, and a hinged scoop for skimming the liquid pollutant from the water surface as the vessel moves. The scoop is equipped with buoys for controlling the level of the inlet end with respect to the water surface. The opposite or discharge end of the scoop is connected to the receiving tank. The receiving tank is mounted for movement relative to the main vessel, such that it can float in the water independently of the main vessel. A primary separating means including settling tanks are supported on the main vessel to receive the collected pollutant and for separation of the water collected with the pollutants. A secondary separating means is connected to the settling tanks for selectively separating the remaining water from the pollutant and for the primary separation and for discharging

ater from the vessel while transferring the covered pollutant to storage tanks for subquent further refinement and use.

EMOVING OIL FROM WASTE WATER WITH LFUR,
noco Production Co., Tulsa, Okla. (Assignee).
W. Jones.
S. Patent No. 3,957,647, 6 p, 6 fig, 7 ref; Official zette of the United States Patent Office, Vol , No 3, p 1233, May 18, 1976.

scriptors: *Patents, *Water pollution control, ter pollution treatment, Water quality control, l pollution, *Oily water, *Coalescence, Coagu- on, *Separation techniques, *Sulfur, Filtration.

ethod of removing dispersed oil from water is contacting the oily water with sulfur to cause oil to coalesce or agglomerate. In a preferred odiment, the water containing the dispersed s flowed through a bed of granular media of ular sulfur or sulfur coated sand, which ents a surface area of solid phase sulfur to esce the dispersed oil. The coalesced oil is separated from the water. In another embodi- t, a sulfur slurry is mixed with the oily water ause the oil to coagulate with the sulfur. A rator, such as a cyclone separator, separates oagulate from the water. (Sinha - OEIS)

OIL COLLECTION AGENTS AND THEIR USE IN CONTAINING OIL SLICKS,
Exxon Research and Engineering Co., Linden, N. J. (Assignee).
G. P. Canevari.
U.S. Patent No. 3,959,134, 6 p, 1 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1739, May 25, 1976.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water pollution sources, *Water pollution treatment, *Water pollution control, Water quality control, Surfactants, Surface tension.
Identifiers: Oil slicks.

It has been found that oil slicks can be contracted and contained by contacting the perimeter of the oil slicks or the water surrounding the oil slicks with an oil collection agent comprised of a mixture of C10-C20 aliphatic monocarboxylic acid or sorbitan monoester in combination with a nonpolar solvent or a solvent package that is essentially nonpolar. The effective spreading caused by the spreading pressure of the oil collection agent thereby reduces the area of the oil slick in size and the oil may thereafter be destroyed or physically removed from the water. The oil collection agents encompassed by this invention have the additional advantages of having low toxicities as well as pour points low enough to enable their use during operations where water and/or air temperatures are less than 45 Deg F. (Sinha-OEIS)
W76-11845

OIL SPILL CLEANUP METHOD AND APPARATUS,
Shell Oil Co., Houston, Tex. (Assignee).
R. R. Ayers, and D. P. Hemphill.
U.S. Patent No. 3,959,136, 4 p, 5 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1740, May 25, 1976.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water pollution sources, *Water pollution treatment, *Water pollution control, Water quality control, *Skimming, Equipment, *Separation techniques.

A method and apparatus is provided whereby an oil spill, in particular a small volume spill, can be skimmed from the water in an efficient and economical manner. The apparatus is a skimmer positioned between the sides of a catamaran and held by hinges so as to be pivotable. The skimmer has baffled entry ports which are arranged on a plane adjustably inclined or about the periphery of a drum so that oil enters to a chamber which is beneath an inverted funnel suspended over the interior of the skimmer or which is the axle of the drum. The skimmer is inclined so that the baffled entry port is at an angle relative to the current. Oil is collected within the skimmer and the position of the skimmer is changed to horizontal. The oil is then withdrawn from the top of the skimmer through the inverted funnel. (Sinha-OEIS)

RELATING ENVIRONMENTAL MODELING TO POLICY ISSUES AND DECISIONS,
Environmental Protection Agency, Washington, D. C.
E. H. Pechan, III, R. A. Luken, and H. M. Maynard.
Ecological Modelling (International Journal on Ecological Modelling and Engineering and Systems Ecology), Vol. 1, No. 1, p 49-65, May 1975. 7 tab, 21 ref.

Descriptors: *Pollution abatement, *Linear programming, *Computer models, *Ecology, Costs, Water, Air, Solid wastes, Thermal pollution, Decision making, Optimization, Computer programs, Equations, Mathematical models, Systems analysis.
Identifiers: Noise, Budgets.

Described is a linear program-based computer model which has been developed to identify the most effective spending patterns for environmental cleanup based on public preferences and spending limitations. The inputs to the model include the costs of removing each residual studied from its various sources. The objective function is the total 'value of removal.' The factor added for each residual consists of a value for the residual multiplied by the quantity or fraction removed. Results of the analysis relate to and support current and projected policy decisions by the U. S. Environmental Protection Agency (EPA) for air and water programs. In addition, the results of the analysis suggest that EPA undertake a redirection of the Nation's resources among residual control programs. (Bell-Cornell)

ECOSYSTEM MODELING OF WATER-HYACINTH MANAGEMENT IN LAKE ALICE, FLORIDA,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
W. J. Mitsch.
Ecological Modelling (International Journal on Ecological Modelling and Engineering and Systems Ecology), Vol. 2, No. 1, p 69-89, March 1976. 13 fig, 2 tab, 35 ref.

Descriptors: *Ecosystems, *Water hyacinth, Management, *Lakes, *Simulation analysis, *Water quality control, Eutrophication, Mathematical models, Diversion, Water quality, Dissolved oxygen, Equations, Computers, Nitrogen, Systems analysis, *Florida.
Identifiers: *Lake Alice(Florida), Bottom detritus decomposer module, Prediction.

A mathematical model was developed for Lake Alice, a small, eutrophic, Karst-topography lake in Gainesville, Florida. The management of the floating aquatic plant, the waterhyacinth (Eichhornia crassipes) was considered one of the main objectives of the model. Simulated diversion of the treated sewage inflow reduced waterhyacinths by 50% or more. Dissolved oxygen remained low. Simulated diversion of the diluting effect of a heating plant effluent led to complete hyacinth takeover and much greater seasonal oscillations in the chemical parameters. Simulated hyacinth control caused the greatest dissolved oxygen fluctuations when spraying and periodic harvesting were tested at least with continuous harvesting. It was suggested that the above-mentioned diversions were shown to be ecologically unattractive even without considering the economic costs of alternatives to lake disposAl. (Bell-Cornell)

CITY--INDUSTRY TEAMWORK SOLVES CRITICAL WASTEWATER PROBLEM,
W. L. Forestell.
The American City Vol 88, p 57-59, July 1973. 3 p, 3 photo.

Descriptors: *Public utilities, *West Virginia, *Waste water disposal, *Waste water treatment, *Chemical wastes, *Sewage, Water pollution control, Pollution abatement, Water pollution sources, Waste disposal, Landfills, Waste water(Pollution), Sewage effluents, Water quality.

When the West Virginia Department of Natural Resources first initiated a program for upgrading the quality of the Kanawha River, both the City of South Charleston and the area's largest industry faced a problem of waste treatment. Instead of building separate facilities the city and Union Carbide Corporation cooperated in building a single plant capable of treating both domestic and industrial waste. Phase one of the project has been in operation since 1963, providing total primary and partial secondary treatment for wastewaters. Phase two, which began operation in 1968, provides total secondary treatment. Phase three is under construction and will be used only for industrial wastes. Initial costs were split between city and industry users with industry paying 90% of annual operating costs. Because the plant is city owned, however, Union Carbide has not become engaged in the legal entanglements a public utility usually encounters. It has nevertheless been in a position to exercise co-control with the city over operations. This cooperative experiment in waste treatment has achieved a marked increase in river water quality. Identifiers: *Oil Pollution Act, *Absolute liability.

The present system of civil liability for oil pollution is incomplete. Left partially or wholly unprotected are the private victim and the publics' recreation and natural resources. International uniformity can be gained by U. S. ratification of the Inter-Governmental Maritime Consultative Organization Liability and Fund Conventions. For domestic protection, a comprehensive U. S. Domestic Oil Pollution Liability and Compensation System should be enacted. These plans are discussed at great length here. Finally, any domestic plan must be both federal and uniform so as to prevent divergent state remedies. A primary theme is that civil liability for the full consequences of environmental harm is necessary. (Frank-Florida)

EVALUATION OF A PNEUMATIC BARRIER FOR OIL CONTAINMENT,
Calspan Corp., Buffalo, N. Y.
J. M. Grace.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-249 361, $5.00 in paper copy, $3.00 in microfiche. Environmental Protection Agency, Environmental Protection Technology Series No. EPA-600/2-76-030, Febuary 1976. 79 p, 42 fig, 14 ref. WPRD 263-01-68.

Descriptors: *Oil pollution, *Rivers, *Water pollution control, Water quality control, *Barriers, *Mechanical equipment, Equipment, Water pollution control, *New York, *Separation techniques.
Identifiers: Pneumatic barriers, *Buffalo River(NY).

The development and evaluation of a pneumatic barrier for restraining the natural flow of surface oils in the Buffalo River is reported. The initial phase of the study involved laboratory experiments to evaluate the surface currents produced by buoyant air-water plumes which were formed by the injection of air through single and multiple orifices submerged below the water surface. Based upon the data obtained in the laboratory experiments, a full scale, prototype air barrier system was designed. This barrier system was built and installed in the river. A full scale test program was initiated in order to evaluate the performance of the barrier. Following the river test phase of the program, additional laboratory tests were conducted in a water channel facility to investigate the performance of a barrier system at higher currents and for different oil types than were available in the Buffalo River. It was determined that a pneumatic barrier could be an effective device for stopping the flow of surface oils for currents less than one foot per second. The actual limiting speed for a particular oil was a function of its viscosity and specific gravity. In no instance was any oil that was tested restrained in a current of more than 1.5 fps. Identifiers: Outer Continental Shelf, Booms, Oil skimmers, System design, Air boom tests.

A relative velocity can be imparted to a floating oil slick by moving an air jet across the surface of the water. If two long booms are arranged in a 'V' shape and moved across an oil slick, the oil will be blown into a concentrated strip which can then be collected with a suitable collector. The collector application in this study used a flow-through trough and a second air boom to skim the oil off the surface and into an oil concentrator. The complete unit was tested by the University of Michigan at speeds up to 7 ft/sec. The 'Vee' air booms did an excellent job of 'herding' the oil with efficiencies ranging from 100% at 1 ft/sec to 80% at 7 ft/sec. The development of the collector did not reach a point where good efficiencies could be obtained above 4 ft/sec. As a part of the program a flow test tank was constructed with a test section 15 feet long, 4 feet wide, and 3 feet deep. The tank would give flow velocities up to approximately 1 ft/sec. DEVELOPMENT AND PRELIMINARY DESIGN OF AN EXPERIMENTAL PROTOTYPE FREE VORTEX OIL SKIMMER,
Scientific Associates, Inc., Santa Monica, Calif.
E. B. Nebeker, and S. E. Rodriguez.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A02 174, $5.00 in paper copy, $3.00 in microfiche. U.S. Cast Guard Final Report No. USCG-D-152-7 June 1975. 93 p, 22 fig, 17 ref, append. DOT-CG 42732-A.

Descriptors: *Oil spills, *Oil pollution, *Skimming, *Pollution abatement, *Water quality control, Water pollution, Resources development, Vortices, *Separation techniques.
Identifiers: Outer Continental Shelf, *Oil skimmers.

An experimental prototype Free Vortex skimmer is described. Results indicate that the development of the Free Vortex has produced a skimmer system which possesses almost all of the performance characteristics usually considered desirable in an oil skimmer. The system is particularly applicable to the operating conditions of: films 2-inch thick and less, operation while stationary and in currents up to 0.75 knots, and severe Sea State 4 waves. The utility of this concept is not limited to these particular conditions but includes many other situations and operating modes. The Free Vortex oil skimmer, with a maximum oil recovery rate of 250 to 300 gpm and fitted with a comminutor/macerator to process debris will weigh about 1300 pounds. The largest dimension is 12 feet when deployed and can be collapsed to 6 feet for transportation. Objectives of the development portion of this program are to develop and improve surface oil capture, vortex generation and vortex-inflow blending, and recovery oil fraction. Results showed that upwelling behavior can be easily eliminated, vortex gen

n was improved by blending the appropriate w field more smoothly, and oil fraction was expectedly good: at a recovery rate of 120 gpm, out 100% oil was recovered at 1/4-inch and ater. (Sinha-OEIS)

COMPENSATION FOR OIL POLLUTION AT SEA: AN INSURANCE APPROACH,
San Diego Univ., Calif. School of Law.
C. F. Goria.
Federation of Insurance Counsel Quarterly, Vol 26, p 3-26 (Fall 1975). 24 p, 133 ref.

Descriptors: *Insurance, *Oil spills, *Water pollution sources, *Oil wastes, *Waste water(Pollution), Waste water disposal, Water pollution, Chemical wastes, Oil industry, Oily water, Ships, International law, International commissions, Civil law.

Monetary damages from oil spill accidents, including cleanup costs and private claims, are inequitably distributed under present liability principles. The author reviews several national approaches to insurance and finds them inadequate, mainly due to extreme limitations of liability. The 1969 Civil Liability Convention, the International Compensation Fund, the Tanker Owners Voluntary Agreement Concerning Liability for Oil Pollution, and the Contract Regarding an Interim Supplement to Tanker Liability for Oil Pollution all go a long way towards but do not protect private claims. The author suggests the deletion of all liability limits on all but private claims. Private claims should be handled by the International Compensation Fund. Loss distribution should involve the shipping industry through higher premiums, the oil companies through higher shipping costs, and the consumer through higher prices. (Frank-Florida)

Identifiers: *FWPCA Amendments of 1972.

The question of whether the discharge of radioactive waste into navigable waters should be regulated by the Environmental Protection Agency or the Atomic Energy Commission (AEC) was decided by a Federal Court of Appeals in 1974, when a citizens' group brought suit to compel the EPA to set limitations on the discharge of radioactive materials from two nuclear facilities into Colorado rivers. The citizens' group contended that the Federal Water Pollution Control Act Amendments of 1972 clearly place the responsibility for regula-

tion of any pollutants on the Environmental Protection Agency (EPA). The EPA, however, argued that the legislative history of the Amendments indicated Congress' intent to exclude special nuclear materials, and that the Atomic Energy Act of 1954 gave the AEC exclusive power over such matter. The Court of Appeals for the Tenth Circuit held that the term 'pollution' as used in the Amendments is unambiguous, and does not exclude any radioactive materials; furthermore, the Atomic Energy Act should not be interpreted so as to divest the EPA from primary responsibility over regulation of any pollution of navigable waters. The court's rationale and the possible impact of the decision are discussed in detail. (Sloan-Florida)

NITRATE POLLUTION AND THE CALIFORNIA ENVIRONMENTAL QUALITY ACT: THE APPROPRIATE SOLUTION TO A NEGLECTED PROBLEM,
L. R. Skidmore, III.
California Western Law Review, Vol. 12, No. 1, p. 122-41 (1975). 20 p, 1 chart.

Descriptors: *California, *Permits, *Nitrates, *Agricultural runoff, *Water pollution control, Federal government, Legislation, Legal aspects, Regulation, Pollution, Administrative agencies, Federal Water Pollution Control Act, Governmental interrelations, State governments, Environmental control, Projects, Local governments, Pollutant identification, Water pollution, Environmental effects.
Identifiers: *National Environmental Policy Act, *California Environmental Quality Act, Environmental impact statement.

The Congress, the Federal Courts, the California legislature and state agencies have all failed to regulate nitrate pollution. The failure to regulate this important source of agricultural groundwater pollution has resulted in the degradation of agricultural product, reduced milk production, and the contamination of drinking water. This comment suggests the viability of applying the California Environmental Quality Act (CEQA) to solve the nitrate pollution problems in California. This would be accomplished through the registration and licensing of fertilizers. CEQA will be applied to those activities sought to be licensed which have discretionary governmental approval as 'statutory projects'. In addition, the activity must have significant and positive environmental effects in order to be licensed. If these factors are met, a Draft Environmental Impact Report (EIR) containing detailed descriptions of the fertilizer registration and licensing project must be prepared and accepted. CEQA will be applied through existing administrative procedures within the California Department of Agriculture. (Hadoulias-Florida)

Identifiers: *Marine pollution, Oceanic ecosystem, Environmental impact.

Since 1968 the National Petroleum Council has undertaken four studies to assist the government in formulating policies in preparation for the United Nations Law of the Sea Treaty negotiations. This article is an extract of one such study dealing with marine oil pollution. Marine petroleum pollution has four major sources. Of these the largest source is land based activities, which account for about 55% of sea pollution. Regulation in this area, however, is primarily a national responsibility beyond the treaty scope. The pollution resulting from natural phenomena is also beyond treaty scope and not discussed. The remaining pollution sources are vessels and offshore production. Of the two, vessel pollution is by far the greater; as a result, several international conventions and informal agreements already exist relating to vessel design, waste treatment, and discharge limitations. The Inter Governmental Maritime Consultative Organization (IMCO) is largely responsible for the improvements. The National Petroleum Council recommends that, because of its past success and experience, IMCO be named as administrative agent for any new international standards. (Comer-Florida)

OIL, SUPER-SHIPS AND THE OCEANS,
J. Frye.
Oceans, Vol. 74, p. 48-55, Jan. 1974. 8 p, 3 photo, 1 dwg, 1 tab.

Descriptors: *Ships, *Oil spills, *Design standards, *Costs, Water pollution control, Transportation, Washington, California, Oil, Oil pollution, Water pollution, Water quality, Water quality control, Environmental effects, Port authorities, Planning, Pollution abatement, Research equipment, Energy, Research priorities, Water quality act, Bacteria, Coasts.

The era of superships has arrived. Supertankers transporting petroleum are expected to present great water pollution problems. Consequently, there has been growing public resistance to the construction of port facilities to accomodate these great ships. The oil companies have responded by promising to pay for various oil spill prevention measures if new shore facilities are approved. The institute for Water Resources ordered studies analyzing the potential water pollution problems from the supertankers. The results of these studies suggest that further research be conducted to explore methods of reducing the possible pollution impact of tankers on coastal waters and shores. Also examined are various water pollution and oil pollution prevention acts having provisions governing tanker design and oil spill control methods, and recent Navy efforts at developing strains of bacteria which consume oil. THE INTRACOASTAL WATERWAY: AN ECOLOGICAL PERSPECTIVE,
Florida Atlantic Univ., Boca Raton. Dept. of Biological Sciences.
G. A. Marsh.
Florida Environmental and Urban Issues, Vol. 11, No. 2, p. 6-7, 13-15(1974). 4 p, 1 photo.

Descriptors: *Florida, *Ecology, *Water quality control, *Human population, *Canals, Recreation, Southeast U. S., Projects, Biota, Biological communities, Dominant organisms, Protection, Water resources, Pollution, Water pollution, Canals, Project planning, Water management(Applied), Mangrove swamps, Water quality, Water policy, Water treatment, Water pollution sources, Waste disposal, Navigation, Natural resources.
Identifiers: *Intracoastal Waterway, *Water Quality Management Plan.

The Intracoastal Waterway (ICWW) connects a series of inland marine water bodies of the Gold Coast and provides a protected boating passage linking the coastal municipalities. It also serves various recreational, drainage and waste disposal needs of Palm Beach, Broward and Dade Counties. Burgeoning population growth has severely lowered water quality in these and other counties. In addition, continuing demand for waterfront acreage has devastated natural shoreline vegetation along inland marine waters. Growing populations have also resulted in sewage wastes entering the inland marine waters. To counteract this condition, centralized collection and treatment systems using non-polluting disposal techniques must be developed. In addition to sewage wastes, other sources of pollution include partially treated domestic wastes, surface runoff from agricultural and urban areas, and decayed organic matter from water hyacinths. The demand for finger-canal developments has resulted in pesticides, grass and shrubbery clippings and other wastes accumulating and decomposing within the canal system. The development of waterfront homesites has also resulted in the devastation of Palm Beach County's mangrove habitat, an area critically important to the coastal ecosystem. Hopefully, implementation of the recently adopted Water Quality Management Plan will improve the quality of the surface waters within Palm Beach County. (Hadoulias-Florida)
W76-11986

EFFLUENT LIMITATIONS GUIDELINES FOR EXISTING SOURCES AND STANDARDS OF PERFORMANCE AND PRETREATMENT STANDARDS FOR NEW SOURCES FOR THE PAVING AND ROOFING MATERIALS (TAR AND ASPHALT) POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 40, No 143, p 31190-95, Jul 24, 1975. 6 p, 11 tab.

Descriptors: *Asphalt, *Standards, *Effluents, *Treatment facilities, *Roofing materials, Paving, Asphaltic concrete, Construction materials, Federal Water Pollution Control Act, Water pollution, Water pollution sources, Water quality, Waste water treatment, Pollutants, Regulation, Administrative agencies, Federal government.
Identifiers: *Administrative regulations, *FWPC Amendments of 1972.

Pursuant to the authority of the Federal Water Pollution Control Act, the Environmental Protection Agency has proposed effluent limitations and guidelines for existing sources and standards of performance for new sources in the paving and roofing materials category. Tables are given setting forth in both English and metric units the standards for each subcategory. Limitations are specified for TSS, pH, and oil and grease. The subcategories covered by the regulation are asphalt emulsion, asphalt concrete, asphalt roofing, and linoleum and printed asphalt felt. The inflationary impact of the proposed regulation is considered to be insignificant. (Capehart-Florida)

n July 9th, President Ford submitted to Congress special message to accompany his proposed omprehensive Oil Pollution Liability and Com- ensation Act of 1975. This legislation, according the President, would establish a comprehensive d uniform system for fixing liability and settling ims for oil pollution damages in United States aters and coastlines. The proposal would also im- ement two international conventions dealing th oil pollution by tankers on the high seas. To event further oil pollution, the legislation would ablish strict liability for pollution damages from ntifiable sources and would provide economic entives to operators to prevent oil spills. In ad- ion to defining liability for oil spills, it would ablish a uniform system for settling claims and assuring that none will go uncompensated, ile at the same time replacing a patchwork of rlapping and sometimes conflicting Federal State laws. 1991

ANIC CHEMICALS MANUFACTURING SOURCE CATEGORY.
nmental Protection Agency, Washington, D.

Register, Vol. 40, No. 100, p. 22402-23, 1975. 22 p, 15 tab.

tors: *Inorganic compounds, *Federal ollution Control Act, *Pollutant identifica- egislation, *Chemical wastes, Technology, ts, Standards, Analytical techniques, l analysis, Water pollution, Chemicals, n abatement, Legal aspects, Legislation, ive analysis, Chemcontrol, Federal ent, Administration, Administrative agen- ndards, Classification.
rs: *FWPCA Amendments of 1972, urces(Pollution).

Pursuant to the authority of the Federal Water Pollution Control Act, the Environmental Protection Agency (EPA) has proposed effluent limitations and guidelines for existing sources and standards of performance and pretreatment standards for existing and new sources in the inorganic chemical manufacturing point source category. Section 306 of the Act requires pollutant discharge control through application of the best available technology. The point source category was studied to determine whether separate limitations are appropriate for different segments within the category. In addition, the control and treatment technologies existing within each segment were identified and the information evaluated. Subsequently, the significant inorganic products segment of the inorganic chemicals manufacturing category was divided into forty-one discrete sub-categories consistent with the specific chemicals produced. Discussion of listed process wastes water pollutants generated by the manufacture of significant inorganic products is included. (Hadoulias-Florida)

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM: SEPARATE STORM SEWERS.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 40, No 235, p 56932-36, December 5, 1975. 5 p.

Descriptors: *Permits, *Storm drains, *Urban drainage, *Storm runoff, Pollutants, Regulation, Agricultural runoff, Industrial wastes, Standards, Effluents, Structures, Pipes, Surface runoff, Cities, Sewers, Separated sewers, Urbanization, Judicial decisions, Administrative agencies, Federal government, State governments, Federal Water Pollution Control Act.
Identifiers: *Administrative regulations.

As directed by order of the federal district court, the Environmental Protection Agency (EPA) has proposed regulations extending the National Pollutant Discharge Elimination System (NPDES) permit system to include point sources in the separate storm sewer category. This category had previously been exempted since the EPA considers that runoff sources are nonpoint in nature and more properly regulated under the Federal Water Pollution Control Act. The proposed regulations define a separate storm sewer as a publicly-owned, urban area pipe system used for the purpose of collecting storm runoff uncontaminated by industrial or commercial wastes. The regulations authorize the discharge of pollutants from separate storm sewers subject to a permit procedure and other requirements which may be prescribed in future regulations. In addition, a discharger may be required to obtain a conventional NPDES permit at anytime. (Capehart-Florida)
W76-11993

OFFSHORE SEGMENT OF THE OIL AND GAS EXTRACTION POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 40, No 179, p 42572-77, September 15, 1975. 6 p, 5 tab.

THE FREEDOM OF NAVIGATION AND THE PROBLEM OF POLLUTION OF THE MARINE ENVIRONMENT,
Gosudarstvennyi Proektno-Izyskatelskii i Nauchno-Issledovatelskii Institut Morskogo Transporta 'Soyuzmorniiproekt', Moscow (USSR).
V. A. Kiselev.
Georgia Journal of International and Comparative Law, Vol 6, p 93-106 (1976). 14 p, 75 ref.

Descriptors: *International law, *United Nations, *Water pollution control, *Oceans, *Law of the sea, Navigation, Water pollution, Marine biology, Legal aspects, Oil spills, Oil wastes, Water policy, Foreign countries, International commissions.

The law of the sea with regard to pollution prevention and liability is changing rapidly. Standards for the prevention of pollution from vessels have been adopted, but standards concerning a ship's construction and equipment should also be adopted on the international level. For their further protection, coastal states should be provided with some rights for combatting pollution within a zone of the high sea bordering on their territorial waters. It would also be helpful if divergent rules and standards concerning pollution prevention among coastal states could be unified for reasons of protection and enforcement. (Frank-Florida)

Examined here are the various international conventions dealing with liability for harm to the marine environment. They include conventions providing protection against oil and nuclear waste, as well as against fishkill. A form of international tort law forms the basis for these conventions. In the Third UN Conference on the Law of the Sea, efforts have been made to include and refine these liability principles into a new law of the sea. Draft articles are presented from the U.S., Australia, Norway, Germany, Canada and other countries. The concept of state liability is only just beginning to take hold. (Frank-Florida)

RESPONSIBILITY AND LIABILITY FOR HARM TO THE MARINE ENVIRONMENT,
International Inst. for Environment and Development, Washington, D.C. North American Office
R. E. Stein.
Georgia Journal of International and Comparative Law, Vol 6, p 41-57 (1976). 17 p, 76 ref.

Descriptors: *International commissions, *International law, *Marine biology, *Oceans, Oil wastes, Oil spills, Water pollution sources, Water pollution treatment, Fish populations, United Nations, *Water pollution control, Pollutants, Fish-kill, Compensation, Water law.

Harm to the marine environment is not being dealt with sufficiently at present. No catalyst exists that would push nations into preventing marine harm or compensating its victims. Transport discharges and wastes, dumping and fish depletion are some of the harms sought to be prevented. Existing control measures exist, and are enumerated here, but they are inadequate. Recommendations are made for new measures to prevent marine harm. (Frank-Florida)

ZERO DISCHARGE: NATIONAL GOAL OR NATIONAL CALAMITY,
Allied Chemical Corp., New York.
J. T. Connor.
Vital Speeches of the Day, Vol 39, p 290-93, March 1, 1972. 4 p.

Descriptors: *Waste treatment, *Water quality standards, Cost-benefit analysis, *Economic impact, *Economic feasibility, Feasibility, Social values, Water policy, Regulation, Water quality control, Water pollution control, Pollution abatement.

A goal of zero discharge of pollutants into the nation's waters, the goal set by the Muskie Bill proposed in 1971, may have financial and human resource costs too high to pay. This speech by the chairman of the board of Allied Chemical Corporation discusses the possible costs and effects of such a goal. Whatever pollution control costs are incurred will eventually be paid by consumers and tax payers. Therefore, arbitrary goals should not be set without careful evaluation. Total pollution control has been conservatively estimated to cost more than 90 billion dollars. Some estimates run as high as 2 or 3 trillion dollars. The question to be answered is whether 100% control is necessary and desirable in the face of such costs. Lesser standards should be considered. A plan to project 100% control while allowing for 'mid-course correction' does not reduce the cost damage but adds the additional problem of passing laws that cannot be obeyed. Before Congress establishes control standards, it must set attainable, balanced goals. (Comer-Florida)

THE ROLE OF NORTH AMERICAN DEEP WATER PORTS,
G. A. Regan.
Vital Speeches of the Day, Vol. 39, p. 455-458, March 26, 1973. 4 p.

Descriptors: *North America, *Oil spills, *Oil industry, *Ships, *Harbors, *Canada, Import, Economic feasibility, Economic efficiency, Employment, Anchors, Naval architecture, Engineering, Energy, Navigation, Deep water.
Identifiers: *Coastal zone management, *Deepwater ports, *Nova Scotia.

Because Americans are consuming their own available fuel at a very high rate, imported oil is essential to the American economy. Projections estimate that by 1985 as much as 15 million barrels will have to be imported every day. The United States, however, has no ports capable of handling the very large crude carriers (VLCCs) which are the most economic transportation means. Since no American ports are even capable of alteration to suit increased needs, this article proposes use of Canadian, Bahama and Carribean ports for U.S. oil unports. Canadian ports are close enough to the heavy oil use areas of the northeastern U. S. to present a viable alternative. Moreover, Canadian ports are already capable of receiving VLCCs. Should the U.S. agree to use of Canadian ports, however, it must recognize that the Canadian government and people may not be willing to assume spillage risks for mere transportation income. The Canadian government will also likely require the construction of oil refineries which could provide Canadian oil workers with jobs previously performed by American workers in U.S. located refineries. SALT MARSHES-ECOSYSTEMS IN DANGER,
Cape Cod Museum of Natural History, Brewster, Mass.
J. Hay.
National Parks and Conservation Magazine, Vol 48, p 16-21 March 1974. 6 p, 1 illus, 11 photo.

Descriptors: *Marshes, *Coastal marshes, *Wetlands, *Estuarine environment, *Dredging, *Salt marshes, Tidal marshes, Waterfowl, Shellfish, Commercial shellfish, Pollution, Commercial fishing, Aquatic life, Aquatic environment, Sport fishing, Estuarine fisheries, Wildlife, Pollution.
Identifiers: *Coastal wetlands, *Dredge and fill operations.

There is an urgent need to strengthen laws for the protection of existing wetlands and for increasing general awareness of the unique value of wetlands. Commercial waterfront developments currently being undertaken for immediate economic gain often destroy critically needed marshlands. The result is that tidal flow is reduced and the marshes lose their ability to sustain living organisms. This leads to a decrease in the numbers and kinds of larger creatures which feed on these organisms. This decrease affects not only wildlife, which are thought of as aesthetically enriching, but also salt-water fish of considerable commercial value. The sport fishing and shellfish industries are also affected since they are dependent on spawning grounds in the coastal wetlands. Protection of the coastal areas may be accomplished through the passage of regulatory legislation and, when sufficient funds are availabl, through the outright acquisition of marshlands through state and local governments. (Sloan-Florida)

SUPERPORTS: THE NEED IS COMING,
Federal Maritime Commission, Washington, D. C.
A. C. Barrett.
Vital Speeches of the Day, Vol 40, p 712-714, August 22, 1974. 3 p.

Descriptors: *Oil spills, *Offshore platforms, *Harbors, *Oil industry, *Ships, Transportation, Economics, Economic efficiency, Economic justification, Water pollution sources, Foreign trade, Import, Legislation, Coastal structures.
Identifiers: Coastal waters, Coastal zone management, Absolute liability.

While the largest tanker at the end of World War II was 18,000 tons, today's tankers range up to 100,000 tons. Unfortunately, the United States is the only major world power unable to accommodate these supertankers. Explored here is the desirability of constructing huge offshore superports capable of handling supertankers. Environmentalists, actively opposing superport construction in the Atlantic, are correct in noting that the risk of oil spill from supertankers is unknown. These tankers are of recent invention and their ability to survive storms and other catastrophes has not been tested. Nevertheless, despite the fact that a spill from such a huge ship could be disastrous, economic factors of effluent oil transportation weigh in favor of supertankers and superports. In addition, an oil receiving facility located well off the coasts would reduce the threat of collision and vessel groundings. As to potential damages resulting from spills, recent congressional proposals provide for a hundred million dollar per accident fund to provide compensation on a no fault basis. (Comer-Florida)

HOW MODERN TECHNOLOGY IS ENDANGERING OUR LIVES: OCEAN POLLUTION,
J. E. J. Piccard
Vital Speeches of the Day, Vol 39, p 179-18
December 3, 1972. 4 p.

Descriptors: *Water pollution effects, *Mari microorganisms, *Food abundanc *Phytoplankton, *Water quality, Water pollut control, Aquatic microbiology, Aquatic envir ment, Pollutant identification, International la Air pollution, Soil contamination, Thermal pol tion, Balance of nature, Environmental effec Pesticides, International commissions.

Besides producing about 20% of the world's fo the sea contributes millions of gallons of oxyge the atmosphere. Sea life, however, is in se danger because of pollution, not only of oceans but also of the land and air. This art proposes that the preservation of sea organis requires both governmental and individual acti Private individuals must realize that biologi equilibrium requires a 50% reduction of the bi rate, a 75% reduction of resource exploitatio 20% reduction of food production and a 5 reduction of pollution. Governments must sev ly reduce or stop pollution of rivers, ban oc dumping, control direct and indirect sewerage p lution of seas, replace long life pesticides w short life ones, and require more efficient auto bile engines. The most efficient and possibly only realistic governmental control must b global authority. Reduction of ocean pollu requires reduction of all pollution because ocean is the ultimate receiver. Examples f London, Zurich and Pittsburg prove that total p lution reduction is possible in a limited ti (Comer-Florida)

PREPARING TO TAKE THE PLU (ATLANTIC OFFSHORE OIL),
P. J. Bernstein.
The Nation, Vol. 217, p 203-207, September 1973. 5 p, 1 map.

Descriptors: *Water resources developm *Offshore platforms, *Oil fields, *Oil s *Atlantic Ocean, *Continental Shelf, Co structures, Coastal marshes, Commercial fis Red tide, Water pollution sources, Water poll effects, Research priorities, Research development, Oily water, Oil reservoirs.
Identifiers: *Coastal zone management, Co waters, Contiguous zone.

A recent survey indicates that the Atlantic tinental shelf contains massive sedime deposits. These deposits may contain oil in qu ties exceeding the world's largest oil Offshore drilling, therefore, seems to be a matter of time. However, environmental issu lated to offshore drilling are as yet unresc This article discusses some of the issues pert to offshore drilling. Oil spillage is of utmost cern. The American Petroleum Institute a that on site spillage is a possibility. The rea cern of environmentalists, however, is the ch pipeline leaks and accidents of transfer onshore facilities. It is this type of spillag results in the worst oil slicks. Estimates in that already spilled oil, if spread throughout the oceans, would form a visibl over the entire area. Other problems with off

illing include development of coastline areas th corresponding loss of natural beauty and inju- s to fishing industries. The New England fishing lustry asserts that it could not survive Atlantic lling. Despite these problems and the recent nplete halt of ocean research, drilling seems in- table. (Comer-Florida)

Descriptors: *Water quality control, *Management, *Monitoring, Data collections, Evaluation, Water pollution control.

Surveillance in water quality management becomes an end in itself rather than a means to an end. Little attempt has been made to check the accuracy of the data, utilize the information it yields, or evaluate changing data collection needs. The strategy developments that have occurred in most states, the importance of the data in the successful implementation of these strategies the failures in utilization of the data, and the proposed remedies for correcting the situation are discussed.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: Dimensioning, Hydroelectric works.

The problems facing hydraulic engineers are of great diversity and decisions in their fields of activity often imply a considerable responsibility in respect to the economic consequences and the social and ecologic effects of such decisions. The operation of water resources development structures depends on the degree of knowledge available on natural data, especially on those related to hydrologic events. A great diversity of situations exists concerning available hydrologic data, covering the whole field from total lack to an acceptable volume of information. It is therefore appropriate to talk about groups or types of methodologies having a common principle, which have then to be adapted to concrete conditions and objectives of each investigated project. The methods which can be applied in case of inadequate hydrological data may be classified as follows: methods based on the generation of synthetic hydrologic sequences, such as Monte Carlo methods; methods based on the generation of hydrologic sequences by correlation with rainfall; methods based on the generalization of results of water resources engineering computations; and methods based on the theory of games. This article presents ways in which these methods can be applied in some key problems of water resources engineering: (1) the dimensioning of river flow regulating works designed for meeting water demands; (2) dimensioning of hydroelectric works; (3) design and operation of flood control developments; and (4) multi-purpose water resources development. ers: *Inadequate data.

ic Commission for Europe (ECE) coun-e experiencing a depletion of natural s due to the accelerating population rate and the economic progress in gical changes. These nations are obliged to improve their water resources management, particularly the accuracy and availability of hydrologic data. This paper appraises the possible economic effect of insufficient hydrological data on the effectiveness of water planning and the design of hydraulic engineering structures and their operation. Considered specifically are: the economic consequences of a deficiency of hydrological data on water planning, construction and operation; and the impact of a deficiency of hydrological data on main water users. These aspects are discussed in terms of following problems: water planning and design; planning and designing of flood protection; the importance of accurate data to show flow formation regarding human activity at watersheds of rivers; domestic and industrial water supply; generation of electric energy by hydro-electric plants and thermal power plants; irrigation; river navigation; fisheries; hydrological forecast for water pollution control programs; sediment control; and data on ice and slush conditions. Insufficient hydrological data and forecasting has considerable impact in all phases of water resources planning and development. (Bell-Cornell)
